Attorneys for Plaintiffs
Par Pharmaceutical, Inc.,
Par Sterile Products, LLC, and
Endo Par Innovation Company, LLC

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF NEW JERSEY

PAR PHARMACEUTICAL, INC., PAR STERILE PRODUCTS, LLC, and ENDO PAR INNOVATION COMPANY, LLC Plaintiffs, v. LUITPOLD PHARMACEUTICALS, INC., DAIICHI SANKYO, INC., and DAIICHI SANKYO COMPANY, LTD., Defendants.	C. A. No. 2:16-cv-02290-WHW-CLW **FIRST AMENDED COMPLAINT FOR PATENT INFRINGEMENT** **FILED UNDER SEAL**

STATEMENT PURSUANT TO L. CIV. R. 10.1

Plaintiff Par Pharmaceutical, Inc. ("Par") is a corporation organized and existing under the laws of the State of New York, having a principal place of business at 1 Ram Ridge Road, Chestnut Ridge, New York 10977. Plaintiff Par Sterile Products, LLC ("Par Sterile") is a limited liability company organized and existing under the laws of Delaware, having its principal place of business at 1 Ram Ridge Road, Chestnut Ridge, New York 10977. Plaintiff Endo Par

Innovation Company, LLC ("EPIC") is a limited liability company organized and existing under the laws of Delaware, having its principal place of business at 1 Ram Ridge Road, Chestnut Ridge, New York 10977. Upon information and belief, Defendant Luitpold Pharmaceuticals, Inc. ("Luitpold") is a corporation organized and existing under the laws of the State of New York, having a principal place of business at One Luitpold Drive, Shirley, New York 11967. Upon information and belief, Defendant Daiichi Sankyo, Inc. ("Daiichi Sankyo") is a corporation organized under the laws of the State of Delaware, having a principal place of business at Two Hilton Court, Parsippany, New Jersey 07054. Upon information and belief, Defendant Daiichi Sankyo Company, Ltd. ("Daiichi Sankyo Co.") is a public company organized under the laws of Japan, having its principal place of business at 3-5-1, Nihonbashi-honcho Chuo-ku, Tokyo, 103-8426, Japan, and having its global clinical development arm, Daiichi Sankyo Pharma Development, at 399 Thornall Street, Edison, New Jersey 08837.

For their Complaint against Luitpold, Daiichi Sankyo, and Daiichi Sankyo Co. (collectively, "Defendants"), Par, Par Sterile, and EPIC (collectively, "Plaintiffs") allege as follows:

NATURE OF THE ACTION

1. This is a civil action for infringement of United States Patent Nos. 9,119,876 and 9,295,657 (collectively, the "Patents-in-Suit"). This action is based upon the Patent Laws of the United States, 35 U.S.C. § 1, et seq.

PARTIES

2. Par is a corporation organized and existing under the laws of the State of New York, having a principal place of business at 1 Ram Ridge Road, Chestnut Ridge, New York 10977. Par is a wholly owned, indirect subsidiary of Endo International PLC. Par develops,

manufactures and markets pharmaceutical products in the United States. As set forth herein, Par is the assignee of the Patents-in-Suit.

3. Par Sterile is a limited liability company organized and existing under the laws of Delaware, having its principal place of business at 1 Ram Ridge Road, Chestnut Ridge, New York 10977. Par Sterile is a wholly owned, indirect subsidiary of Endo International PLC. Par Sterile develops, manufactures and markets injectable products, and provides manufacturing services to the biopharmaceutical and pharmaceutical industry.

4. EPIC is a limited liability company organized and existing under the laws of Delaware, having its principal place of business at 1 Ram Ridge Road, Chestnut Ridge, New York 10977. EPIC is a wholly owned subsidiary of Par Pharmaceutical, Inc. and is the exclusive licensee of the Patents-in-Suit.

5. Upon information and belief, Defendant Luitpold is a corporation organized and existing under the laws of the State of New York, having a principal place of business at One Luitpold Drive, Shirley, New York 11967. Upon information and belief, Luitpold is a wholly owned subsidiary of Daiichi Sankyo Co. Upon information and belief, Luitpold is in the business of manufacturing, distributing, and selling pharmaceutical products throughout the United States, either on its own or through its affiliates, and Luitpold regularly conducts business in New Jersey. Upon information and belief, Luitpold also provides contract manufacturing services to the biopharmaceutical and pharmaceutical industry.

6. Upon information and belief, Defendant Daiichi Sankyo is a corporation organized under the laws of the State of Delaware, having a principal place of business at Two Hilton Court, Parsippany, New Jersey 07054. Upon information and belief, Daiichi Sankyo is the US division of Daiichi Sankyo Co.

7. Upon information and belief, Defendant Daiichi Sankyo Co. is a public company organized under the laws of Japan, having its principal place of business at 3-5-1, Nihonbashi-honcho Chuo-ku, Tokyo, 103-8426, Japan, and having its global clinical development arm, Daiichi Sankyo Pharma Development, at 399 Thornall Street, Edison, New Jersey 08837. Upon information and belief, Luitpold's parent company, Daiichi Sankyo Co. regularly conducts business within New Jersey, and has substantial contacts with the State of New Jersey.

JURISDICTION AND VENUE

8. This Court has jurisdiction over the subject matter of this action pursuant to 28 U.S.C. §§ 1331, 1338(a), 2201, and 2202.

9. This Court has personal jurisdiction over Defendants for the reasons set forth below and for other reasons that will be presented to the Court if such jurisdiction is challenged.

10. This Court has personal jurisdiction over Luitpold because, inter alia, Luitpold has purposefully availed itself of the rights and benefits of New Jersey law by engaging in systematic and continuous contacts with New Jersey.

11. Luitpold is registered as a pharmaceutical manufacturer in the State of New Jersey under Business ID Number 0400585757.

12. Upon information and belief, Luitpold regularly and continuously transacts business within the state of New Jersey, either on its own or through its affiliates, including selling such pharmaceutical products as DexIron (iron dextran injection, USP) and Venofer (iron sucrose injection). Upon information and belief, Luitpold has agreements with pharmaceutical retailers, wholesalers, or distributors providing for the distribution of its products in the State of New Jersey.

13. Upon information and belief, Luitpold derives substantial revenue from the sale of those products in New Jersey and has availed itself of the privilege of conducting business within the State of New Jersey.

14. In addition, Luitpold has purposely availed itself of this forum by filing suit in at least the following actions: *Luitpold Pharmaceuticals, Inc. v. Amneal Pharmaceuticals, LLC, et al.*, C.A. No. 3-12-05064-JAP (D.N.J.) and *Egalet US, Inc. v. Apotex Corp. et al.*, C.A. No. 1-14-04409-RMB (D.N.J.).

15. Upon information and belief, Luitpold's systematic and continuous business contacts within New Jersey render it at home in New Jersey.

16. This Court has personal jurisdiction over Luitpold insofar as, upon information and belief, it is a wholly owned subsidiary of Daiichi Sankyo, which has purposefully availed itself of the rights and benefits of New Jersey law by engaging in systematic and continuous contacts with New Jersey. Daiichi Sankyo has its headquarters at Two Hilton Court, Parsippany, New Jersey 07054.

17. Daiichi Sankyo is the U.S. division of Daiichi Sankyo Co. Daiichi Sankyo Co. has its global clinical development arm, Daiichi Sankyo Pharma Development, at 399 Thornall Street, Edison, New Jersey 08837. Upon information and belief, Daiichi Sankyo Co. directly or indirectly through Daiichi Sankyo and Luitpold markets, distributes, and sells drug products throughout the United States, including the State of New Jersey.

18. Such significant contacts by Luitpold's parent company, which parent's activities are clearly directed at the forum, further render Luitpold at home in the forum.

19. This Court has personal jurisdiction over Daiichi Sankyo because, inter alia, Daiichi Sankyo has purposefully availed itself of the rights and benefits of New Jersey law by engaging in systematic and continuous contacts with the State of New Jersey.

20. Upon information and belief, Daiichi Sankyo is registered in the State of New Jersey under Business ID Number 0100693643 with the business purpose of marketing pharmaceutical products.

21. Upon information and belief, Daiichi Sankyo regularly and continuously transacts business within the State of New Jersey, either on its own or through its affiliates, including marketing pharmaceutical products.

22. Upon information and belief, Daiichi Sankyo derives substantial revenue from its business and marketing activities in the State of New Jersey and has availed itself of the privilege of conducting business within the State of New Jersey.

23. In addition, Daiichi Sankyo has purposely availed itself of this forum by filing suit in at least the following actions: *Eli Lilly and Company, et al. v. Accord Healthcare, Inc., et al.*, C.A. No. 2-14-01643-CCC (D.N.J.); *Eli Lilly and Company, et al. v. Par Pharmaceuticals Companies, Inc., et al.*, C.A. No. 2-14-00508-CCC (D.N.J.); *Daiichi Sankyo Company, Limited, et al. v. Mylan Pharmaceuticals Inc., et al.*, C.A. No. 2-07-cv-03039-WJM (D.N.J.); *Daiichi Sankyo Company, Limited, et al. v. Matrix Laboratories, Ltd., et al.*, C.A. No. 2-08-cv-02752-WJM (D.N.J.); *Daiichi Sankyo Company, Limited, et al. v. Mylan Pharmaceuticals Inc., et al.*, C.A. No. 2-06-cv-03462-WJM (D.N.J.).

24. Upon information and belief, Daiichi Sankyo's systematic and continuous business contacts within New Jersey render it at home in the State of New Jersey.

25. This Court has personal jurisdiction over Daiichi Sankyo Co. because, inter alia, Daiichi Sankyo Co. has purposefully availed itself of the rights and benefits of New Jersey law by engaging in systematic and continuous contacts with the State of New Jersey.

26. Upon information and belief, Daiichi Sankyo Co. regularly and continuously transacts business within the State of New Jersey, either on its own or through its affiliates, including marketing and developing pharmaceutical products. Upon information and belief, Daiichi Sankyo Co.'s global clinical development arm, Daiichi Sankyo Pharma Development, is located at 399 Thornall Street, Edison, New Jersey 08837.

27. Upon information and belief, Daiichi Sankyo Co. derives substantial revenue from its business activities in the State of New Jersey and has availed itself of the privilege of conducting business within the State of New Jersey.

28. In addition, Daiichi Sankyo Co. has purposely availed itself of this forum by filing suit in at least the following actions: *Eli Lilly and Company, et al. v. Accord Healthcare, Inc., et al.*, C.A. No. 2-14-01643-CCC (D.N.J.); *Eli Lilly and Company, et al. v. Par Pharmaceuticals Companies, Inc., et al.*, C.A. No. 2-14-00508-CCC (D.N.J.); *Daiichi Sankyo Company, Limited, et al. v. Mylan Pharmaceuticals Inc., et al.*, C.A. No. 2-07-cv-03039-WJM (D.N.J.); *Daiichi Sankyo Company, Limited, et al. v. Matrix Laboratories, Ltd., et al.*, C.A. No. 2-08-cv-02752-WJM (D.N.J.); *Daiichi Sankyo Company, Limited, et al. v. Mylan Pharmaceuticals Inc., et al.*, C.A. No. 2-06-cv-03462-WJM (D.N.J.).

29. Upon information and belief, Daiichi Sankyo Co.'s systematic and continuous business contacts within New Jersey render it at home in the State of New Jersey.

30. In the alternative, should Daiichi Sankyo Co. contest jurisdiction in this forum, this Court has personal jurisdiction over Daiichi Sankyo Co. under Fed. R. Civ. P. 4(k)(2)

because, on information and belief, Daiichi Sankyo Co. is not subject to jurisdiction in any state's courts of general jurisdiction, and because exercising jurisdiction is nevertheless consistent with the United States Constitution given that Daiichi Sankyo Co. has sufficient contacts with the United States.

31. Upon information and belief, this Court has personal jurisdiction over Defendants for the reasons stated herein, including, *inter alia*, Defendants' activities in the forum, activities directed at the forum, and significant contacts with the forum, all of which render Defendants at home in the forum.

32. This Court also has personal jurisdiction over Defendants under FEDERAL RULE OF CIVIL PROCEDURE 4(k)(2).

33. Venue is proper in this Court pursuant to 28 U.S.C. § 1391 and 28 U.S.C. § 1400(b).

THE PATENTS-IN-SUIT

34. United States Patent No. 9,119,876 ("the '876 patent"), titled "Epinephrine Formulations," was duly and legally issued by the United States Patent and Trademark Office ("PTO") on September 1, 2015, to Par Pharmaceutical, Inc., the assignee of the named inventors. Par has been, and continues to be, the sole assignee of the '876 patent.

35. A true and correct copy of the '876 patent is attached as Exhibit A.

36. The '876 patent is directed to pharmaceutical compositions comprising epinephrine.

37. United States Patent No. 9,295,657 ("the '657 patent"), titled "Epinephrine Formulations," was duly and legally issued by the PTO on March 29, 2016, to Par Pharmaceutical, Inc., the assignee of the named inventors. Par has been, and continues to be, the sole assignee of the '657 patent.

38. The ’657 patent is directed to methods of treating various conditions, such as anaphylaxis and the induction and maintenance of mydriasis during intraocular surgery, by administering pharmaceutical compositions comprising epinephrine.

39. A true and correct copy of the ’657 patent is attached as Exhibit B.

ADRENALIN®

40. Par Sterile holds approved NDA Nos. 204200 and 204640 for ADRENALIN®, 1 mg base/mL and 30 mg base/30 mL, respectively. ADRENALIN® is the first FDA-approved epinephrine injection product for use in a clinical setting available in the United States. The prescribing information for ADRENALIN® (“ADRENALIN® Label”) instructs physicians to administer ADRENALIN® to patients to treat anaphylaxis. Upon information and belief Defendant Luitpold previously marketed an unapproved epinephrine injection product through its subsidiary American Regent and this unapproved epinephrine injection product was the subject of a nationwide recall due to “discoloration and small visible particles.”

41. Around 2007, FDA announced it would take action against these unapproved drugs due to concerns about the safety, effectiveness, and manufacturing quality of drugs that have not gone through the rigorous FDA-approval process.

42. ADRENALIN® went through the rigorous FDA-approval process. Plaintiffs’ predecessor, JHP Pharmaceuticals (“JHP”), initially applied for FDA approval of the epinephrine formulation it had marketed for over 100 years. FDA then required JHP to meet strict impurity level requirements for ADRENALIN®. In communications with JHP, FDA expressed that impurities reduced the potency of the product, which could be pharmaceutically unacceptable to patients suffering from emergency anaphylaxis who are in need of potent medication in a short amount of time. JHP undertook a significant initiative to begin developing a new epinephrine formulation that could meet FDA’s impurity requirements.

43. FDA approved NDA No. 204200 (1 mg base/mL) in December 2012 and NDA No. 204640 (30 mg base/30 mL) in December 2013. FDA conditioned its approval on JHP conducting several post-marketing studies and committing to reduce the impurity level of ADRENALIN® further. In particular, because of FDA's concerns and requirements, FDA required JHP to evaluate formulation and process improvements to reduce the levels of impurities, and to take steps to further minimize the level of certain impurities.

44. Par Sterile undertook the post-marketing commitment, and completed the development of a new formulation with significantly fewer impurities as FDA required. Based on the significant research it had conducted, Par Sterile obtained the Patents-in-Suit, which cover the new formulation and methods of using the new formulation to treat various conditions such as anaphylaxis and maintenance of mydriasis during intraocular surgery. In line with its post-marketing commitments that were a condition of approval of NDA Nos. 204200 and 204640, Par Sterile also submitted supplemental NDAs to FDA for approval of the new formulation. In December 2015, FDA approved Par Sterile's supplemental NDA for NDA No. 204640 (30 mg base/30 mL) covering the new formulation. In September 2016, FDA approved Par Sterile's supplemental NDA for NDA No. 204200 (1 mg base/mL) covering the new formulation.

45. The publication "Approved Drug Products with Therapeutic Equivalence Evaluations" (the "Orange Book") identifies drug products approved on the basis of safety and effectiveness by FDA under the Federal Food, Drug, and Cosmetic Act. Pursuant to 21 U.S.C. § 355(b)(1) and attendant FDA regulations, the '876 and '657 patents were listed in the Orange Book with respect to ADRENALIN®.

DEFENDANTS' INFRINGEMENT OF THE PATENTS-IN-SUIT

46. Upon information and belief, Luitpold submitted ANDA No. 207-568 to FDA, under the Federal Food, Drug, and Cosmetic Act (21 U.S.C. § 355(j)), seeking approval to

engage in the commercial manufacture, use, sale, offer for sale, and/or importation of a generic version of ADRENALIN® (epinephrine injection), prior to the expiration of the Patents-in-Suit.

47. By a letter dated March 9, 2016 (the "First Notice Letter"), Luitpold stated that it had submitted ANDA No. 207-568 seeking approval to engage in the commercial manufacture, use, sale, offer for sale, and/or importation of a generic version of ADRENALIN® (epinephrine injection) prior to the expiration of the '876 patent.

48. The First Notice Letter stated that ANDA No. 207-568 contains a "Paragraph IV" certification that alleges the '876 patent is invalid, unenforceable and/or will not be infringed by the manufacture, use, sale, offer for sale, or importation of Defendants' generic version of ADRENALIN® (epinephrine injection). The First Notice Letter did not include any arguments that the '876 patent is invalid or unenforceable.

49. By letter dated July 7, 2016 (the "Second Notice Letter"), Luitpold stated that it had submitted ANDA No. 207-568 seeking approval to engage in the commercial manufacture, use, sale, offer for sale, and/or importation of a generic version of ADRENALIN® (epinephrine injection), prior to the expiration of the '657 patent.

50. The Second Notice Letter also stated that ANDA No. 207-568 contains a "Paragraph IV" certification that alleges the '657 patent is invalid, unenforceable and/or will not be infringed by the manufacture, use, sale, offer for sale, or importation of Defendants' generic version of ADRENALIN® (epinephrine injection). The Second Notice Letter did not include any arguments that the '657 patent is invalid or unenforceable.

51. Upon information and belief, Defendants' reference listed drug ("RLD") is ADRENALIN®, which means that Defendants' generic version of ADRENALIN® (epinephrine injection) will be the pharmaceutical equivalent of ADRENALIN®. Upon information and

belief, Defendants are relying on and incorporating by reference the safety and efficacy information that FDA relied upon in making its final determination of approval for ADRENALIN®.

52. In the Hatch-Waxman context, the infringement analysis is dictated by the contents of Defendants' ANDA and ongoing ANDA supplements and/or amendments, as well as FDA's likely requirements for the drug composition and formulation that will be finally approved. The infringement analysis is not dictated by the contents of any of Defendants' manufacturing guidelines, existing products, or Defendants' "guarantees" of what FDA will approve. *See Sunovion Pharm., Inc. v. Teva Pharm. USA, Inc.*, 731 F.3d 1271, 1279 (Fed. Cir. 2013). The scope of what Defendants "ask[] for and receive[] approval to market, if within the scope of a valid claim, is an infringement." *Id*.

53. Because Defendants' ANDA has not yet been approved, the infringement inquiry necessarily focuses on "what the ANDA applicant will likely market if its application is approved, an act that has not yet occurred." *Bayer AG v. Elan Pharmaceutical Res. Corp.*, 212 F.3d 1241, 1248 (Fed. Cir. 2000) (quoting *Glaxo, Inc. v. Novopharm, Ltd.*, 110 F.3d 1562, 1569 (Fed. Cir. 1997)). Here, the infringement inquiry necessarily focuses on the product that Defendant Luitpold will likely market if its ANDA receives final FDA approval ("Luitpold's Generic Product").

54. Upon information and belief, and after a reasonable opportunity for further investigation and discovery, Defendants have represented to FDA that Luitpold's Generic Product will have the same active ingredient as ADRENALIN®, the same or equivalent inactive ingredients as ADRENALIN®, and the same route of administration as ADRENALIN®. Upon information and belief, and after a reasonable opportunity for further investigation and discovery,

Defendants have represented to FDA that Luitpold's Generic Product will be bioequivalent to ADRENALIN®. Upon information and belief, and after a reasonable opportunity for further investigation and discovery, Defendants have represented to FDA that Luitpold's Generic Product will have the same indication as ADRENALIN®.

55. FDA conditioned approval of ADRENALIN® on its formulation having low levels of impurities, and upon JHP's commitment to perform post-marketing studies and reduce the impurity levels further. Upon information and belief, and upon a reasonable opportunity for further investigation and discovery, Luitpold proposed a product to FDA having impurity levels higher than the levels in ADRENALIN®. Upon information and belief, just as it did while evaluating ADRENALIN®, FDA will require Luitpold's Generic Product to have reduced impurity levels. Upon information and belief, FDA will require Luitpold's Generic Product to have the same or equivalent ingredients and, therefore, the same or equivalent formulation as ADRENALIN®, to, *inter alia*, reduce the impurity levels.

56. [redacted]

57. Upon information and belief, Luitpold's Generic Product will have a formulation covered by one or more claims of the '876 patent and will be administered to practice the methods covered by one or more claims of the '657 patent.

58. On information and belief, and after a reasonable opportunity for further investigation and discovery, Luitpold's ANDA essentially copies the ADRENALIN® Label as required by FDA under 21 C.F.R. § 314.94(a)(iv), and therefore the label for Luitpold's Generic Product will instruct physicians to administer Luitpold's Generic Product (epinephrine injection) to treat anaphylaxis. On information and belief, physicians will follow these instructions in the label for Luitpold's Generic Product. The use of Luitpold's Generic Product to treat this condition is an infringement of the claims of the '657 patent. By seeking approval of a label that instructs physicians to practice the patented methods, Defendants are actively inducing infringing acts with a specific intent to encourage infringement of the '657 patent.

59. Defendants have known of the '657 patent at least as early as the filing of the Complaint. Defendants have known of the '876 patent at least as early as March 9, 2016, the date of the First Notice Letter.

60. Upon information and belief, Defendants will also contributorily infringe one or more claims of the '657 patent under 35 U.S.C. § 271(c) in that Defendants will make, use, sell, offer to sell, and/or import Luitpold's Generic Product, which Defendants know have no substantial non-infringing uses. Luitpold's Generic Product will be a material part of practicing the methods of treating anaphylaxis claimed in the '657 patent because Luitpold's Generic Product will be a pharmaceutical equivalent to ADRENALIN®, and ADRENALIN® is indicated to treat that condition.

61. On information and belief, the manufacture, importation, use, offer for sale, or sale of Luitpold's Generic Product will occur at Defendants' behest, and with their intent, knowledge and encouragement.

62. Upon information and belief, Defendants Daiichi Sankyo and Daiichi Sankyo Co. participated in, contributed to, actively induced, encouraged, aided, or abetted Luitpold's preparation, submission, and filing of ANDA No. 207-568 with a paragraph IV certification.

63. Defendants Daiichi Sankyo and Daiichi Sankyo Co.'s inducement, encouragement, aiding, or abetting of Luitpold's preparation, submission, and filing of ANDA No. 207-568 with a paragraph IV certification constitutes infringement of the Patents-in-Suit under 35 U.S.C. § 271(e)(2)(A). Further, Defendants Daiichi Sankyo and Daiichi Sankyo Co.'s manufacture, commercial use, sale, offer for sale, and/or importation of Luitpold's Generic Product would induce and/or contribute to Luitpold's infringement of the Patents-in-Suit under 35 U.S.C. § 271(b) and/or 35 U.S.C. § 271(c).

64. The acts of infringement by Defendants set forth above will cause Plaintiffs irreparable harm for which they have no adequate remedy at law, and will continue unless enjoined by this Court.

COUNT I
(Infringement of the '876 Patent by Defendants)

65. Plaintiffs incorporate each of the preceding paragraphs 1 to 64 as if fully set forth herein.

66. Defendant Luitpold's submission of ANDA No. 207-568, including its inclusion of section 355(b)(2)(A)(iv) allegations, constitutes infringement of the '876 patent pursuant to 35 U.S.C. § 271(e)(2).

67. On information and belief, upon FDA approval of NDA No. 207-568, Defendants will infringe the '876 patent by making, using, offering to sell, or selling Luitpold's Generic Product in the United States and/or importing Luitpold's Generic Product into the United States,

and by actively inducing and/or contributing to infringement by others, in violation of 35 U.S.C. § 271(a), (b), (c), and/or (g), literally and/or through the doctrine of equivalents.

68. Defendants Daiichi Sankyo and Daiichi Sankyo Co.'s inducement, encouragement, aiding, or abetting of Luitpold's preparation, submission, and filing of ANDA No. 207-568 with a paragraph IV certification constitutes infringement of the Patents-in-Suit under 35 U.S.C. § 271(e)(2)(A). Further, Defendants Daiichi Sankyo and Daiichi Sankyo Co.'s actions in encouraging, promoting, contributing to, aiding and/or abetting the manufacture, commercial use, sale, offer for sale, and/or importation of Luitpold's Generic Product would infringe or induce and/or contribute to Luitpold's infringement of the '876 patent under 35 U.S.C. § 271(b) and/or 35 U.S.C. § 271(c).

COUNT II
(Declaratory Judgment of Infringement of the '876 Patent by Defendants)

69. Plaintiffs incorporate each of the preceding paragraphs 1 to 68 as if fully set forth herein.

70. This claim arises under the Declaratory Judgment Act, 28 U.S.C. §§ 2201 and 2202.

71. Plaintiffs are further entitled to a declaration that, if Defendants, prior to patent expiry, commercially manufacture, use, offer for sale, or sell Luitpold's Generic Product within the United States, import Luitpold's Generic Product into the United States, or induce or contribute to such conduct, Defendants would infringe the '876 patent under 35 U.S.C. § 271(a), (b), (c), and/or (g), literally and/or through the doctrine of equivalents.

72. Plaintiffs will be irreparably harmed by Defendants' infringing activities unless those activities are enjoined by this Court. Plaintiffs do not have an adequate remedy at law.

COUNT III
(Infringement of the '657 Patent by Defendants)

73. Plaintiffs incorporate each of the preceding paragraphs 1 to 72 as if fully set forth herein.

74. Defendant Luitpold's submission of ANDA No. 207-568 constitutes infringement of the '657 patent pursuant to 35 U.S.C. § 271(e)(2).

75. Upon FDA approval of ANDA No. 207-568, Defendants will infringe the '657 patent by making, using, offering to sell, or selling Luitpold's Generic Product in the United States and/or importing Luitpold's Generic Product into the United States, and by actively inducing and/or contributing to infringement by others, in violation of 35 U.S.C. § 271(a), (b), (c), and/or (g), literally and/or through the doctrine of equivalents.

76. Defendants Daiichi Sankyo and Daiichi Sankyo Co.'s inducement, encouragement, aiding, or abetting of Luitpold's preparation, submission, and filing of ANDA No. 207-568 with a paragraph IV certification constitutes infringement of the Patents-in-Suit under 35 U.S.C. § 271(e)(2)(A). Further, Defendants Daiichi Sankyo and Daiichi Sankyo Co.'s actions in encouraging, promoting, contributing to, aiding and/or abetting the manufacture, commercial use, sale, offer for sale, and/or importation of Luitpold's Generic Product would induce and/or contribute to Luitpold's infringement of the '657 patent under 35 U.S.C. § 271(b) and/or 35 U.S.C. § 271(c).

COUNT IV
(Declaratory Judgment of Infringement of the '657 Patent by Defendants)

77. Plaintiffs incorporate each of the preceding paragraphs 1 to 76 as if fully set forth herein.

78. This claim arises under the Declaratory Judgment Act, 28 U.S.C. §§ 2201 and

79. Plaintiffs are further entitled to a declaration that, if Defendants, prior to patent expiry, commercially manufacture, use, offer for sale, or sell Luitpold's Generic Product within the United States, import Luitpold's Generic Product into the United States, or induce or contribute to such conduct, Defendants will infringe the '657 patent under 35 U.S.C. § 271(a), (b), (c) and/or (g), literally and/or through the doctrine of equivalents.

80. Plaintiffs will be irreparably harmed by Defendants' infringing activities unless those activities are enjoined by this Court. Plaintiffs do not have an adequate remedy at law.

PRAYER FOR RELIEF

WHEREFORE, Plaintiffs respectfully request the following relief:

A. A judgment that Defendants infringed, contributed to, or induced the infringement of each of the claims of the Patents-in-Suit, literally and/or through the Doctrine of Equivalents by contributing to, inducing the submission of, or submitting ANDA No. 207-568;

B. A declaration that if Defendants, prior to patent expiry, commercially manufacture, use, offer for sale, or sell Luitpold's Generic Product within the United States, import Luitpold's Generic Product into the United States, or induce or contribute to such conduct, Defendants infringe the Patents-in-Suit pursuant to 35 U.S.C. § 271(a), (b), or (c);

C. An order issued pursuant to 35 U.S.C. § 271(e)(4) that the effective date of any approval of ANDA No. 207-568 shall not be earlier than the expiration dates of the Patents-in-Suit, including any extensions and/or additional periods of exclusivity to which Plaintiffs are or become entitled;

D. An order requiring Luitpold to amend its Paragraph IV certification to a Paragraph III certification as provided in 21 C.F.R. § 314.94(a)(12)(viii)(A);

E. A preliminary and permanent injunction restraining and enjoining Defendants and their officers, agents, attorneys and employees, and those acting in privity or concert with them,

from engaging in the commercial manufacture, use, offer to sell, or sale within the United States, or importation into the United States of Luitpold's Generic Product until the expiration of the Patents-in-Suit, including any extensions and/or additional periods of exclusivity to which Plaintiffs are or may become entitled;

F. That Plaintiffs be awarded monetary relief if Defendants commercially manufacture, use, offer for sale, or sell Luitpold's Generic Product, or any other product that infringes or induces or contributes to the infringement of the Patents-in-Suit, within the United States before the latest expiration date of any of the Patents-in-Suit, including any extensions and/or additional periods of exclusivity to which Plaintiffs are or become entitled;

G. An award of costs and expenses in this action; and

H. Such other and further relief as the Court may deem just and proper.

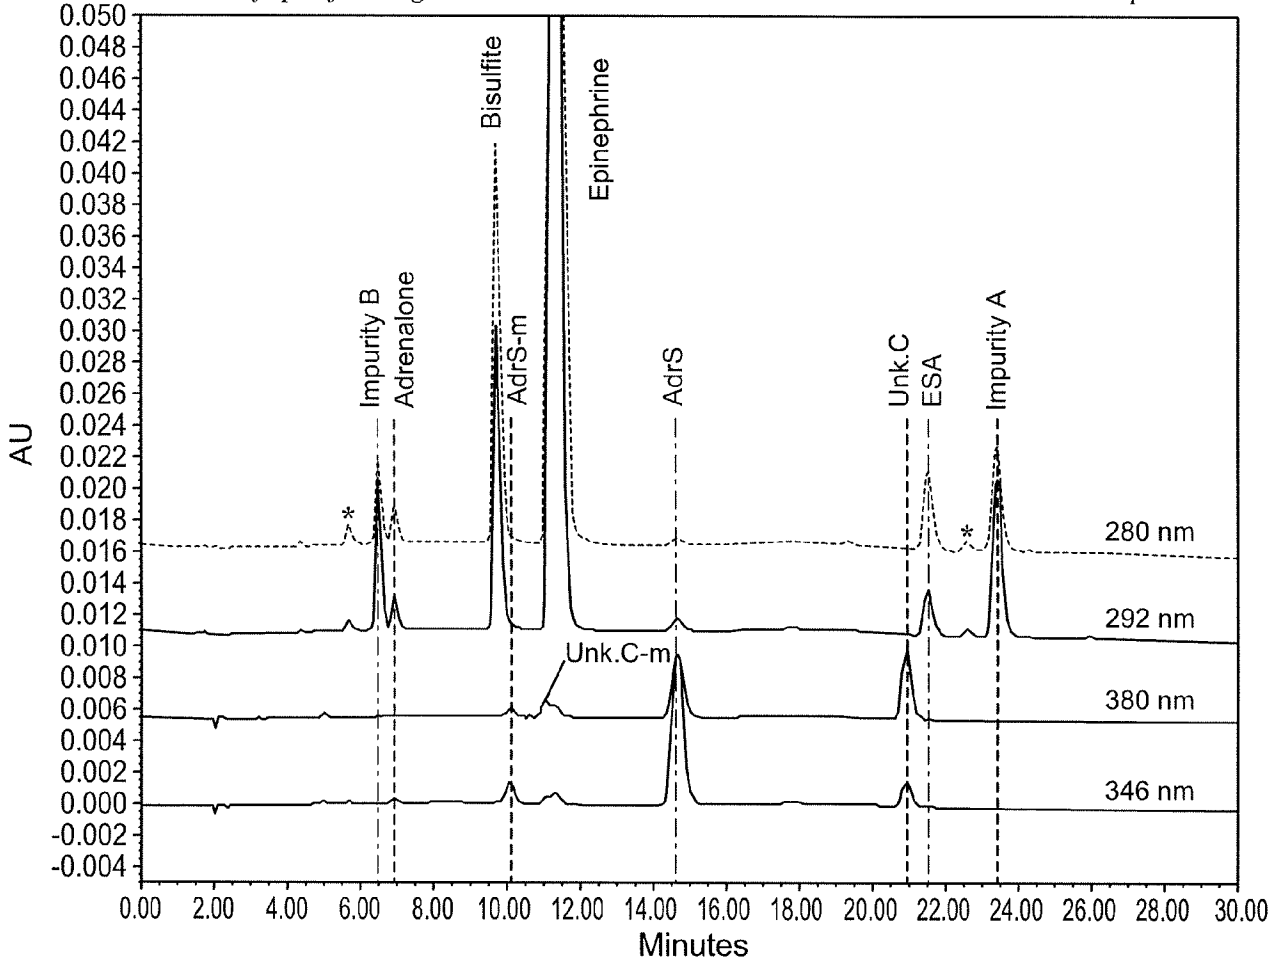
Labeled peaks are specified degradants, except for AdrS-m and Unk.C-m, which are minor isomers of specified degradants. Peaks marked with a "" are unlabeled minor components in the mixture.*



EPINEPHRINE FORMULATIONS

FIELD OF THE INVENTION

The present invention provides pharmaceutical compositions comprising epinephrine, methods of administration, and methods of making the same.

BACKGROUND

Epinephrine, also known as 4-[(1R)-1-Hydroxy-2-(methylamino)ethyl]-1,2-benzenediol, is the active principle of the adrenal medulla and an endogenous catecholamine which acts directly on both alpha and beta adrenergic receptors. When used in pharmaceutical compositions, epinephrine can act as a non-selective alpha and beta adrenergic agonist and can work rapidly to improve breathing, stimulate the heart, raise dropping blood pressure, reverse hives, and reduce swelling of the face, lips, and throat. Uses for epinephrine include emergency treatment of allergic reactions (Type 1), including anaphylaxis, induction and maintenance of mydriasis during intraocular surgery, treatment of bronchospasm, sensitivity reactions, cardiac arrhythmias, GI and renal hemorrhage, superficial bleeding, premature labor, hypoglycemia, and cardiogenic, hemorrhagic, and traumatic shock. Epinephrine can also be used to increase blood flow in ACLS during CPR, as an adjunct to local anesthesia, and for radiographic uses.

One example of a pharmaceutical composition with epinephrine as an active agent is Adrenalin®, a sympathomimetic agent manufactured and distributed by Par Sterile Products, LLC. Adrenalin® is an epinephrine injection suitable for subcutaneous, intracameral, and intramuscular administration. When diluted, it may also be administered as ophthalmic irrigation or intracameral injection. Adrenalin® is used primarily as an emergency treatment of allergic reactions (Type 1), including anaphylaxis, and for induction and maintenance of mydriasis during intraocular surgery.

Adrenalin® is a clear, colorless solution containing 1 mg/mL epinephrine in a clear glass vial. Adrenalin® is currently available in 1 mL single-dose and 30 mL multi-dose formulations. For the 1 mL product, each 1 mL of Adrenalin® contains 1 mg epinephrine, 9.0 mg sodium chloride, 1.0 mg sodium metabisulfite, hydrochloric acid to adjust pH, and water for injection. For the 30 mL product, each 1 mL of Adrenalin® solution contains 1 mg epinephrine, 9.0 mg sodium chloride, 1.5 mg sodium metabisulfite, hydrochloric acid to adjust pH, 5.4 mg chlorobutanol as a preservative and water for injection. The pH range of Adrenalin® is 2.2-5.0.

Adrenalin® 1 mL is FDA approved for an 18 month shelf life. The Adrenalin® 30 mL product is approved for an even shorter shelf life of 14 months. Shelf life is limited by the formation of degradants, which mainly comprise epinephrine sulfonic acid (ESA) and D-epinephrine, an enantiomer of L-epinephrine that has insignificant therapeutic activity. The currently approved Adrenalin® 1 mL product has a total impurity limit of ≤20%. Adrenalin® 1 mL has a concentration limit of ≤13.5% ESA and ≤9.5% D-epinephrine. The currently approved Adrenalin® 30 mL product has a total impurity limit of ≤20%. Adrenalin®30 mL has a concentration limit of ≤14.5% ESA and ≤9.5% D-epinephrine.

There is currently a need in the art for improved epinephrine-containing pharmaceuticals. It is an object of the present invention to provide an epinephrine-containing pharmaceutical composition that addresses some of the limitations of present formulations.

SUMMARY OF THE INVENTION

The present invention provides a pharmaceutical composition comprising epinephrine. The composition may be useful for emergency treatment of allergic reactions (Type 1), including anaphylaxis, induction and maintenance of mydriasis during intraocular surgery, treatment of bronchospasm, sensitivity reactions, cardiac arrhythmias, GI and renal hemorrhage, superficial bleeding, premature labor, hypoglycemia, and cardiogenic, hemorrhagic, and traumatic shock. The composition may also be used to increase blood flow in ACLS during CPR, as an adjunct to local anesthesia, and for radiographic uses. The composition may be administrable via subcutaneous, intracameral, intravenous, and intramuscular injection, infusion, intra-arterial administration, intracardiac injection, endotracheal administration, intraosseous administration, oral inhalation, topical administration, and as ophthalmic irrigation.

The present invention also provides for a composition comprising at least one of an active agent, a pH raising agent, an antioxidant, a transition metal complexing agent, a pH lowering agent, a tonicity regulating agent, optionally a preservative, and optionally a solvent.

The present invention also provides for compositions with low levels of D-epinephrine.

The present invention also provides for compositions with low levels of epinephrine sulfonic acid (ESA).

The present invention also provides for compositions with low levels of oxidative degradants.

The present invention also provides for compositions with low levels of total impurities.

The present invention also provides for compositions comprising a pH raising agent.

The present invention also provides for compositions comprising an antioxidant.

The present invention also provides for compositions that may resist significant pH change over shelf life.

The present invention also provides for a method of making such compositions.

The present invention also provides for a method of treating a medical condition comprising administering to a subject in need thereof a composition of the present invention.

BRIEF DESCRIPTION OF THE FIGURES

FIG. **1** is a chromatogram of the Impurities Marker Solution using isocratic HILIC with 15% water.

FIG. **2** is a chromatogram of the Impurities Marker Solution using isocratic HILIC with 18% water.

FIG. **3** is a chromatogram of the Impurities Marker Solution using isocratic HILIC with 22% water.

FIG. **4** is a chromatogram of the Impurities Marker Solution using gradient HILIC separation.

DETAILED DESCRIPTION OF THE INVENTION

The present invention provides a pharmaceutical composition comprising epinephrine. The composition may be useful for emergency treatment of allergic reactions (Type 1), including anaphylaxis, induction and maintenance of mydriasis during intraocular surgery, treatment of bronchospasm, sensitivity reactions, cardiac arrhythmias, GI and renal hemorrhage, superficial bleeding, premature labor, hypoglycemia, and cardiogenic, hemorrhagic, and traumatic shock. The composition may also be used to increase blood flow in ACLS during CPR, as an adjunct to local anesthesia, and for radiographic uses. The composition may be administrable via sub-

cutaneous, intracameral, intravenous, and intramuscular injection, infusion, intra-arterial administration, intracardiac injection, endotracheal administration, intraosseous administration, oral inhalation, topical administration, and as ophthalmic irrigation.

The present invention provides for a composition comprising at least one of an active agent, a pH raising agent, an antioxidant, a transition metal complexing agent, a pH lowering agent, a tonicity regulating agent, optionally a preservative, and optionally a solvent.

In some preferred embodiments, the composition may comprise an active agent, a pH raising agent, an antioxidant, a pH lowering agent, and a tonicity regulating agent. In some preferred embodiments, the composition may comprise an active agent, an antioxidant, and a tonicity regulating agent. In some preferred embodiments, the composition may comprise an active agent, a transition metal complexing agent, a pH raising agent, a pH lowering agent, and a tonicity regulating agent. In some preferred embodiments, the composition may comprise an active agent, a transition metal complexing agent, an antioxidant, and a tonicity regulating agent. In some preferred embodiments, the composition may comprise an active agent, a pH raising agent, a pH lowering agent, and a tonicity regulating agent. One of ordinary skill will appreciate that the combination of components in the composition may be varied in order to obtain compositions with desired properties.

In some embodiments, the active agent comprises epinephrine and/or salts thereof. Examples of epinephrine salts include, but are not limited to, acetate, carbonate, citrate, hydrochloride, hydrocyanide, hydrofluoride, nitrate, nitrite, phosphate, and sulfate salts. Preferably, the salt is a hydrochloride salt.

In some embodiments, the active agent is present at a concentration sufficient for any of the uses described herein. In some embodiments, the active agent is present at a concentration of about 0.1 to 2 mg/mL, preferably about 0.5 to 1.5 mg/mL, more preferably about 0.75 to 1.25 mg/mL, and most preferably about 1 mg/mL. In some embodiments, the active agent is present at a concentration of 1.14 mg/mL.

The present invention provides for a composition that may comprise at least one pH raising agent in an amount that raises the pH of the composition. In some embodiments, the pH raising agent comprises a buffer system. The term "buffer system" refers to a component present in a composition or solution which may provide a resistance to significant change in pH caused by a strong acid or base. A buffer system may comprise a single agent or more than one agent, such as a weak acid and its conjugate base. A buffer system may provide a resistance to a significant pH change by interacting with a strong acid or strong base in a composition or solution, thereby at least partially preventing the pH of the composition or solution from changing significantly.

Generally, a buffer system has one or more buffer ranges wherein the buffer system has the ability to provide resistance to significant pH change. When a composition or solution comprising the buffer system has a pH inside the buffer system's buffer range, the pH of the composition or solution will not change significantly with the addition of equimolar amounts of a strong acid or strong base.

The buffer range of a buffer system is related to the acid dissociation constant (K_a) of one or more weak acids comprised by the buffer system. The term "acid dissociation constant" refers to the equilibrium constant of a dissociation reaction of an acid. The midpoint of a buffer range for a buffer system is generally about the logarithmic measure of the acid dissociation constant (i.e., the pK_a, equal to $-\log_{10}K_a$) of a weak acid comprised by the buffer system.

In some embodiments, the pH raising agent may comprise one or more pK_a values. In some embodiments, the pH raising agent may comprise a pK_a value that is within +/−1 unit of the initial pH of the pharmaceutical composition in the form of a solution without the pH raising agent. In some embodiments, the pH raising agent may have a pK_a value within the range of about 2 to 5, preferably within the range of about 3 to 4.5, more preferably within the range of about 3.5 to 4.5, and most preferably about 4.

In some embodiments, the pH raising agent may have a buffer range from a pH of about 2 to 5, preferably from a pH of about 3 to 4.5, and most preferably from a pH of about 3.5 to 4.5.

In some embodiments, the pH raising agent may provide a resistance to a significant change in pH that other components of the composition may otherwise cause in the absence of the pH raising agent. In some preferred embodiments, the pH raising agent may provide a resistance to the composition's pH being significantly lowered by degradants and/or reaction products of other components of the composition. For example, the pH raising agent may help resist an increase in acidity associated with the chemical reaction of an antioxidant.

In some embodiments, the pH raising agent may be present at a concentration in the range of about 0.1 and 4 mg/mL, preferably in the range of about 1 and 3 mg/mL, preferably in the range of about 1.5 and 2.5 mg/mL, and most preferably about 2.25 mg/mL. In some embodiments, the pH raising agent may be present at a concentration that provides a resistance to a significant change in the composition's pH despite physical and chemical changes of the composition after a certain period of shelf life.

In some embodiments, the pH raising agent is selected such that the degradation of other components of the composition is slowed or reduced, as compared to a composition in which the pH raising agent is not present. For example, the pH raising agent may at least in part help prevent significant degradation of an antioxidant after a certain period of shelf life.

In some embodiments, the pH raising agent is selected such that less antioxidant is present, as compared to a composition in which the pH raising agent is not present.

For example, the pH raising agent may be selected such that the concentration of antioxidant necessary for preventing and/or inhibiting the formation of unacceptable amounts of oxidative degradants in the composition after a certain period of shelf life is lowered by in the range of about 10% to 90%, preferably in the range of about 20% to 80%, more preferably in the range of about 25% and 75%, more preferably in the range of about 30% and 70%, and most preferably in the range of about 40% and 60%, as compared to a composition in which the pH raising agent is not present.

In some embodiments, the pH raising agent and pH raising agent concentration is such that compositions conform to the limit on total acidity imposed by the United States Pharmacopeia (USP) 37-NF 32, S2, monograph, effective from Dec. 1, 2014. For example, the pH raising agent may be selected such that when 5.0 mL of the composition is titrated with 0.01 N NaOH, the total amount of titrant necessary to reach a pH of 7.4 is no more than 25 mL. The pH raising agent may be selected such that the composition has a titratable acid concentration of in the range of about 30 to 70 mM, preferably in the range of about 40 and 60 mM, and most preferably about 50 mM.

In some embodiments, the pH raising agent is suitable for subcutaneous, intracameral, intramuscular, parenteral, and/or ophthalmic use.

Preferably, pH raising agents comprise the acids or salt forms of one or more of lactate, tartarate, glutamate, malate, citrate, gluconate, benzoate, succinate, acetate, glycine, and aspartate, as well as lithium hydroxide, sodium hydroxide, potassium hydroxide, rubidium hydroxide, cesium hydroxide, calcium hydroxide, strontium hydroxide, and barium hydroxide. Preferably, the pH raising agent comprises at least one of tartaric acid and sodium hydroxide, and more preferably both of these compounds.

The present invention provides for a composition that may comprise at least one antioxidant. The term "antioxidant" refers to a component in a composition that may prevent and/or inhibit the formation of unacceptable amounts of oxidative degradants in the composition after a certain period of shelf life. In some embodiments, the antioxidant may react with oxygen that might otherwise compromise the composition by producing impurities in the composition. Oxygen may originate from the composition's environment or the composition itself. For example, oxygen may originate from residual oxygen present in the headspace of vials containing the composition.

In some embodiments, the oxidative degradants comprise one or more of adrenochrome, adrenolutin, and melanins.

In some embodiments, the antioxidant may limit the formation of oxidative degradants in the composition to less than about 1%, preferably less than about 0.1%, more preferably less than about 0.05%, more preferably less than about 0.04%, more preferably less than about 0.03%, more preferably less than about 0.02%, more preferably less than about 0.01%, most preferably less than about 0.009%, after a certain period of shelf life.

In some embodiments, the antioxidant may inhibit and/or prevent the composition from undergoing unacceptable physical changes. In some embodiments, the antioxidant may inhibit and/or prevent unacceptable composition color change. In some embodiments, the antioxidant may inhibit and/or prevent unacceptable amounts of insoluble particles.

In some embodiments, the antioxidant may inhibit and/or prevent the composition from undergoing unacceptable color changes that may be detected by visually examining a portion of a sample in a clear, glass test tube against a white background. In some embodiments, the antioxidant may inhibit and/or prevent the composition from undergoing unacceptable color changes that may be detected by comparing the absorbance of a sample of the composition in a 1-cm quartz cell using a spectrophotometer set at 460 nm with a 0.0004 N Iodine Standard Solution that is prepared with water and iodine. In some embodiments, the antioxidant may inhibit and/or prevent the composition from containing unacceptable amounts of particulate matter that may be detected by the methods described in USP <788> and/or USP <789>, the disclosures of which are included herein by reference.

In some embodiments, the antioxidant may be present at the lowest concentration that will inhibit and/or prevent the composition from undergoing unacceptable physical changes. In some embodiments, the antioxidant may be present at the lowest concentration that will inhibit and/or prevent unacceptable oxidation of components of the composition.

In some embodiments, the antioxidant may be present at a concentration of in the range of about 0.1 to 0.9 mg/mL, preferably in the range of about 0.2 and 0.8 mg/mL, more preferably in the range of about 0.3 and 0.7 mg/mL, more preferably in the range of about 0.4 and 0.6 mg/mL, and most preferably about 0.4 to 0.5 mg/mL.

In some embodiments, the concentration of antioxidant in the composition after a certain period of shelf life may be affected by other components of the composition that reduce and/or slow the rate of antioxidant degradation.

In some embodiments, other components of the composition may reduce and/or slow oxidation of the antioxidant after a certain period of shelf life. For example, when the antioxidant is sodium bisulfite, sodium metabisulfite, or another sulfite, other components of the composition may reduce and/or slow the oxidation of bisulfite to bisulfate.

In some embodiments, other components of the composition may reduce and/or slow protonation and/or desolvation reactions involving the antioxidant over a certain period of shelf life. For example, when the antioxidant is sodium bisulfite, sodium metabisulfite, or another sulfite, other components of the composition may reduce and/or slow the conversion to sulfur dioxide.

In some embodiments, other components of the composition may reduce and/or slow the degradation of antioxidant by raising the composition's initial pH and/or the pH of the composition after a certain period of shelf life, as compared to a composition in which the other components are not present. In some embodiments, the pH raising agent may, at least in part, lead to a reduction in the total degradation and/or degradation rate of antioxidant in the composition after a certain period of shelf life.

In some embodiments, other components are present in the composition at a concentration that reduces the concentration of antioxidant degradation products present in the composition after a certain period of shelf life. In some embodiments, other components are present in the composition at a concentration that increases the concentration of the antioxidant present in the composition after a certain period of shelf life, as compared to a composition in which the other components are not present. In some embodiments, the reduction and/or inhibition of unacceptable antioxidant degradation after a certain period of shelf life may reduce the initial concentration of antioxidant necessary to inhibit and/or prevent the composition from undergoing unacceptable physical changes after a certain period of shelf life. In some embodiments, less than about 90% of the initial amount of antioxidant is degraded after a certain period of shelf life, more preferably less than about 85%, more preferably less than about 80%, more preferably less than about 75%, more preferably less than about 70%, more preferably less than about 60%, more preferably less than about 50%, more preferably less than about 40%, more preferably less than about 30%, more preferably less than about 20%, and most preferably less than about 10%.

Preferably, pharmaceutically-acceptable antioxidants comprise one or more of an amino acid sulfite (e.g L-lysine sulfite), ascorbic acid, ascorbyl palmitate, benzotriazol, butylhydroxyanisole (BHA), butylhydroxytoluene (BHT), citric acid, cysteine, cysteine hydrochloride, disodium calcium ethylenediaminetetraacetate, disodium ethylenediaminetetraacetate, dithiothreitol, DL-alpha-tocopherol, erythorbic acid, ethoxyquin, ethylenediaminetetraacetic acid salts, fumaric acid, glutathione, guaiac, homocysteine, isopropyl citrate, L-ascorbate stearate esters, monothioglycerol, nordihydroguaiaretic acid (NDGA), palmitic acid ascorbic acid, pentaerythrityl-tetrakis[3-(3,5-di-t-butyl-4-hydroxyphenyl)propionate]2-mercaptobenzimidazole, potassium dichloroisocyanurate, propyl gallate, rongalite (CH_2OHSO_2Na), sodium ascorbate, sodium bisulfite, sodium edetate, sodium erythorbate, sodium hydrogen

sulfite, sodium metabisulfite, sodium pyrosulfite 1,3-butylene glycol, sodium sulfite, sodium thioglycolate, sodium thiosulfate, soybean lecithin, tert-butyl hydroquinone, thioglycerol, thiourea, TPGS (tocopherol polyethylene glycol succinate), vitamin E and derivatives thereof, α-thioglycerin, and/or salts thereof. Preferably, the antioxidant comprises sodium bisulfite or sodium metabisulfite.

The present invention provides a composition that may include one or more transition metal complexing agents.

In some embodiments, the transition metal complexing agent may be a chelating agent. The term "chelating agent" refers to a substance capable of chelation, i.e, the formation or presence of two or more separate coordinate bonds between a polydentate ligand and a single central atom.

In some embodiments, the transition metal complexing agent may reduce the catalytic activity of trace metals present in the composition. In some embodiments, the transition metal complexing agent may chelate trace metals in the composition that may otherwise increase and/or accelerate the degradation of components in the composition. Examples of trace metals include, but are not limited to, iron, magnesium, lithium, zinc, copper, chromium, nickel, cobalt, vanadium, arsenic, molybdenum, manganese, selenium, and calcium.

In some embodiments, the transition metal complexing agent may chelate trace metals in the composition that may otherwise increase and/or accelerate degradant formation in the composition. In some embodiments, the transition metal complexing agent may inhibit the formation of degradants formed from the interaction of epinephrine, bisulfite, and oxygen. In some embodiments, these degradants comprise one or more of Impurity A, Impurity B, and Unknown C.

In some embodiments, the concentration of the transition metal complexing agent present in the composition may be such that the concentration of Impurity A, Impurity B, or Unknown C is about 1% or less of the composition after a certain period of shelf life, preferably about 0.9% or less, more preferably about 0.8% or less, more preferably about 0.7% or less, more preferably about 0.6% or less, more preferably about 0.5% or less, more preferably about 0.4% or less, more preferably about 0.3% or less, more preferably about 0.2% or less, and most preferably about 0.1% or less.

In some embodiments, the transition metal complexing agent may be present at the lowest concentration that reduces and/or inhibits degradation of other components of the composition. In some embodiments, the transition metal complexing agent may be present in the composition at a concentration of about 0.1 and 0.5 mg/mL, preferably in the range of about 0.1 and 0.4 mg/mL, more preferably in the range of about 0.1 and 0.3 mg/mL, and most preferably about 0.2 mg/mL.

Preferably, transition metal complexing agents comprise one or more of TPA (Tris[(2-pyridyl)methyl]amine), phanquinone (4,7-phenanthroline-5,6-dione), clioquinol (PN Gerolymatos SA), chloroquinol, penicillamine, trientine, N,N'-diethyldithiocarbamate (DDC), 2,3,2'-tetraamine (2,3,2'-tet), neocuproine, N,N,N',N'-tetrakis(2-pyridylmethyl) ethylenediamine (TPEN), 1,10-phenanthroline (PHE), tetraethylenepentamine (TEPA), triethylene tetraamine and tris(2-carboxyethyl)phosphine (TCEP), bathophenanthroline disulfonic acid (BPADA), Disodium Edetate Dihydrate (EDTA), ethylene glycol (bis) aminoethyl ether tetra acetic acid (EGTA), nitrilotriacetic acid, TIRON™, N,N-bis(2-hydroxyethyl)glycine (bicine), O,O'-bis(2-aminophenyl ethylene glycol) ethylenediamine-N,N,N',N'-tetraacetic acid (BAPTA), trans-1,2-diamino cyclohexane-ethylenediamine-N,N,N',N'-tetraacetic acid (CyDTA), 1,3-diamino-2-hydroxy-propane-ethylenediamine-N,N,N', N'-tetraacetic acid (DPTA-OH), ethylene-diamine-N,N'-dipropionic acid dihydrochloride (EDDP), ethylenediamine-N,N'-bis(methylenephosphonic acid) hemihydrate (EDDPO), ethylenediamine-N,N,N',N'-tetrakis(methylenephosphonic acid) (EDTPO), N,N'-bis(2-hydroxybenzyl)ethylene diamine-N,N'-diacetic acid (HBED), 1,6-hexamethylenediamine-N,N,N',N'-tetraacetic acid (HDTA, or HEDTA), N-(2-hydroxyethyl)iminodiacetic acid (HIDA), iminodiacetic acid (IDA), 1,2-diaminopropane-N,N,N',N'-tetraacetic acid (methyl-EDTA), nitriltriacetic acid (NTA), nitrilotripropionic acid (NTP), nitrilotris (methylenephosphonic acid) trisodium salt (NTPO), triethylenetetramine-N,N,N',N'',N''-hexaacetic acid (TTHA), bathocuproine, bathophenanthroline, TETA, citric acid, salicylic acid, and/or malic acid, including analogues, derivatives, and pharmaceutically acceptable salts thereof. Preferably, the metal complexing agent comprises EDTA.

The present invention provides a composition that may include one or more pH lowering agent. The term "pH lowering agent" refers to a component of a composition selected to lower the composition's pH. In some embodiments, the pH lowering agent may be present in the composition such that the composition's pH is in a pharmaceutically acceptable range (i.e., not toxic or producing unacceptable side effects).

In some embodiments, the pH lowering agent may convert the active agent into a salt that is soluble in the composition. In some embodiments, the pH lowering agent may convert epinephrine into a hydrochloride salt.

In some embodiments, the pH lowering agent may be present at a concentration in the composition such that to the composition's pH is within the limit on total acidity imposed by the USP 37-NF 32, S2, monograph. In some embodiments, the pH lowering agent may be present in the composition at a concentration of in the range of about 0.1 to 1 mg/mL, preferably in the range of about 0.1 to 0.5 mg/mL, and most preferably about 0.25 mg/mL.

Preferably, the pH lowering agent comprises one or more of acetic acid, adipic acid, ascorbic acid, citric acid, hydrochloric acid, lactic acid, malic acid, monopotassium phosphate, monosodium phosphate, phosphoric acid, pyrophosphoric acid, succinic acid, sulfuric acid, and or tartaric acid. Preferably, the pH lowering agent comprises hydrochloric acid. In certain embodiments, the pH lowering agent may be a portion of the buffer system in conjugation with a pH raising agent.

The present invention provides for a composition that may comprise at least one tonicity regulating agent. The term "tonicity" refers to the effective osmotic pressure equivalent of a solution or composition. In some embodiments, the tonicity regulating agent may be present in the composition to maintain the tonicity of the composition in a physiological acceptable range. In some embodiments, the tonicity regulating agent may be an osmotic pressure regulating agent.

Preferably, the tonicity regulating agent comprises one or more of glucose, glycerin, hydroxypropyl methyl cellulose, mannitol, polysorbate, propylene glycol, sodium bromide, sodium chloride, sodium iodide, sorbitol, urea, xylitol, and/or combinations thereof. Preferably, the tonicity regulating agent comprises sodium chloride.

In some embodiments, the tonicity regulating agent may be present in the composition at a concentration of in the range of about 4 and 9 mg/mL, preferably in the range of about 5 and 8 mg/mL, and most preferably in the range of about 6 and 7.5 mg/mL. In some embodiments, the tonicity regulating agent may be present at a concentration of about 7.3 mg/mL. In some embodiments, the tonicity regulating agent may be present at a concentration of about 6.15 mg/mL.

The present invention provides for a composition that may optionally comprise one or more preservatives. The term "preservative" refers to a substance present in a composition which can, at least in part, prevent and/or reduce decomposition of the composition. In some embodiments, the preservative may prevent and/or reduce decomposition of the composition by microbial growth in the composition. Preferably, the preservative is pharmaceutically acceptable.

In some embodiments, the preservative may be present in the composition at a concentration that allows for a multi-dose formulation of the composition. In some embodiments, the preservative may be present in the composition at a concentration that prevents and/or reduces decomposition of unused portions of the composition in a multi-dose formulation. In some embodiments, the preservative may allow for up to about 14 days of use, preferably up to about 30 days of use, more preferably up to about 60 days of use, and most preferably up to about 90 days of use of a multi-dose formulation of the composition.

In some embodiments, the preservative may be present in the composition at a concentration of in the range of about 1 to 10 mg/mL, preferably in the range of about 3 and 7 mg/mL, more preferably in the range of about 4 and 6 mg/mL, more preferably in the range of about 4.5 and 5.5 mg/mL, and most preferably at about 5 mg/mL.

Preferably, preservatives comprise one or more of benzalkonium chloride, benzethonium chloride, benzoic acid, benzyl alcohol, benzyl paraben, bronopol, butyl paraben, cetrimide, cetylpyridinium chloride, chlorbutanol, chlorhexidine, chlorocresol, chloroxylenol, cresol, ethyl alcohol, ethyl paraben, ethylparaben, glycerin, hexetidine, imidurea, isobutyl paraben, meta-cresol, methyl paraben, methylparaben, phenol, phenoxyethanol, phenylethyl alcohol, phenylmercuric nitrate, p-hydroxybenzoic acid esters, polyhexamethylene biguanide ("PHMB"), potassium sorbate, propyl paraben, propylene glycol, sodium benzoate, sodium perborate, sodium propionate, sorbic acid, stabilized thimerosal, and/or thimerosal. Preferably, the preservative comprises chlorobutanol.

The present invention provides for a composition that can optionally comprise one or more solvents. In some embodiments, the solvent may be acceptable for pharmaceutical administration. Examples of methods of pharmaceutical administration include, but are not limited to, subcutaneous, intracameral, intravenous, and intramuscular injection, infusion, intra-arterial administration, intracardiac injection, endotracheal administration, intraosseous administration, oral inhalation, topical administration, and as ophthalmic irrigation.

Preferably, the solvent comprises one or more of acetic acid, acetone, acetonitrile, animal oil, aqueous buffer, benzene, bisabolol, butanol, carbon tetrachloride, chlorobenzene, chloroform, dimethylformamide, dioxane, essential oil, ethanol, ethyl acetate, ethyl oleate, ethylene chloride, fatty acid esters, glycerin, glycofurol, hexane, hydrogenated vegetable oil, isopropanol, isopropyl alcohol, isopropyl myristate, isopropyl palmitate, methanol, methylene chloride, mineral oil, polyethylene glycol, polyol, propylene glycol, silicone fluid glyceride, squalane, terpene, tetrahydrofuran, toluene, triacetin, tributyl citrate, triethyl citrate, vegetable oil, and/or water. Preferably the solvent comprises water.

In some embodiments, the solvent may be present in an amount that brings the composition to a final volume which is suitable for administration. In some embodiments, the final volume may be 1 mL. In some embodiments, the final volume may be 30 mL.

The present invention provides for a composition that may have a low level of impurities. The term "impurity" refers to an undesired substance in a composition. In some embodiments, an amount of impurities may be present in an initial composition and/or may be formed after a certain period of shelf life of a composition. In some embodiments, impurities may be formed via degradation of one or more components of the composition. Sources of degradation include, but are not limited to, oxidation, racemization, sulfite addition, visible light, ultraviolet light, moisture, heat, changes in pH, and composition component interactions. Unless indicated otherwise, the percentages of impurities expressed herein are expressed as % w/w of the active agent.

In some embodiments, the composition may have no more than about 20% of total impurities after a certain period of shelf life, more preferably no more than about 19.5%, more preferably no more than about 19%, more preferably no more than about 18.5%, preferably no more than about 18%, more preferably no more than about 17.5%, more preferably no more than about 17%, more preferably no more than about 16.5%, more preferably no more than about 16%, more preferably no more than about 15.5%, more preferably no more than about 15%, more preferably no more than about 14.5%, more preferably no more than about 14%, more preferably no more than about 13.5%, more preferably no more than about 13%, more preferably no more than about 12.5%, more preferably no more than about 12%, more preferably no more than about 11.5%, more preferably no more than about 11%, more preferably no more than about 10.5%, more preferably no more than about 10%, more preferably no more than about 9.5%, more preferably no more than about 9%, more preferably no more than about 8.5%, more preferably no more than about 8%, more preferably no more than about 7.5%, more preferably no more than about 7%, more preferably no more than about 6.5%, more preferably no more than about 6%, more preferably no more than about 5.5%, and most preferably no more than about 5%.

In some embodiments, the composition may have no more than about 20% of total impurities after a certain period of shelf life, preferably no more than about 19.9%, more preferably no more than about 19.8%, more preferably no more than about 19.7%, more preferably no more than about 19.6%, more preferably no more than about 19.5%, more preferably no more than about 19.4%, more preferably no more than about 19.3%, more preferably no more than about 19.2%, more preferably no more than about 19.1%, more preferably no more than about 19%, more preferably no more than about 18.9%, more preferably no more than about 18.8%, more preferably no more than about 18.7%, more preferably no more than about 18.6%, more preferably no more than about 18.5%, more preferably no more than about 18.4%, more preferably no more than about 18.3%, more preferably no more than about 18.2%, more preferably no more than about 18.1%, more preferably no more than about 18%, more preferably no more than about 17.9%, more preferably no more than about 17.8%, more preferably no more than about 17.7%, more preferably no more than about 17.6%, more preferably no more than about 17.5%, more preferably no more than about 17.4%, more preferably no more than about 17.3%, more preferably no more than about 17.2%, more preferably no more than about 17.1%, more preferably no more than about 17%, more preferably no more than about 16.9%, more preferably no more than about 16.8%, more preferably no more than about 16.7%, more preferably no more than about 16.6%, more preferably no more than about 16.5%, more preferably no more than about 16.4%, more preferably no more than about 16.3%, more

preferably no more than about 16.2%, more preferably no more than about 16.1%, more preferably no more than about 16%, more preferably no more than about 15.9%, more preferably no more than about 15.8%, more preferably no more than about 15.7%, more preferably no more than about 15.6%, more preferably no more than about 15.5%, more preferably no more than about 15.4%, more preferably no more than about 15.3%, more preferably no more than about 15.2%, more preferably no more than about 15.1%, more preferably no more than about 15%, more preferably no more than about 14.9%, more preferably no more than about 14.8%, more preferably no more than about 14.7%, more preferably no more than about 14.6%, more preferably no more than about 14.5%, more preferably no more than about 14.4%, more preferably no more than about 14.3%, more preferably no more than about 14.2%, more preferably no more than about 14.1%, more preferably no more than about 14%, more preferably no more than about 13.9%, more preferably no more than about 13.8%, more preferably no more than about 13.7%, more preferably no more than about 13.6%, more preferably no more than about 13.5%, more preferably no more than about 13.4%, more preferably no more than about 13.3%, more preferably no more than about 13.2%, more preferably no more than about 13.1%, more preferably no more than about 13%, more preferably no more than about 12.9%, more preferably no more than about 12.8%, more preferably no more than about 12.7%, more preferably no more than about 12.6%, more preferably no more than about 12.5%, more preferably no more than about 12.4%, more preferably no more than about 12.3%, more preferably no more than about 12.2%, more preferably no more than about 12.1%, more preferably no more than about 12%, more preferably no more than about 11.9%, more preferably no more than about 11.8%, more preferably no more than about 11.7%, more preferably no more than about 11.6%, more preferably no more than about 11.5%, more preferably no more than about 11.4%, more preferably no more than about 11.3%, more preferably no more than about 11.2%, more preferably no more than about 11.1%, more preferably no more than about 11%, more preferably no more than about 10.9%, more preferably no more than about 10.8%, more preferably no more than about 10.7%, more preferably no more than about 10.6%, more preferably no more than about 10.5%, more preferably no more than about 10.4%, more preferably no more than about 10.3%, more preferably no more than about 10.2%, more preferably no more than about 10.1%, more preferably no more than about 10%, more preferably no more than about 9.9%, more preferably no more than about 9.8%, more preferably no more than about 9.7%, more preferably no more than about 9.6%, more preferably no more than about 9.5%, more preferably no more than about 9.4%, more preferably no more than about 9.3%, more preferably no more than about 9.2%, more preferably no more than about 9.1%, more preferably no more than about 9%, more preferably no more than about 8.9%, more preferably no more than about 8.8%, more preferably no more than about 8.7%, more preferably no more than about 8.6%, more preferably no more than about 8.5%, more preferably no more than about 8.4%, more preferably no more than about 8.3%, more preferably no more than about 8.2%, more preferably no more than about 8.1%, more preferably no more than about 8%, more preferably no more than about 7.9%, more preferably no more than about 7.8%, more preferably no more than about 7.7%, more preferably no more than about 7.6%, more preferably no more than about 7.5%, more preferably no more than about 7.4%, more preferably no more than about 7.3%, more preferably no more than about 7.2%, more preferably no more than about 7.1%, more preferably no more than about 7%, more preferably no more than about 6.9%, more preferably no more than about 6.8%, more preferably no more than about 6.7%, more preferably no more than about 6.6%, more preferably no more than about 6.5%, more preferably no more than about 6.4%, more preferably no more than about 6.3%, more preferably no more than about 6.2%, more preferably no more than about 6.1%, more preferably no more than about 6%, more preferably no more than about 5.9%, more preferably no more than about 5.8%, more preferably no more than about 5.7%, more preferably no more than about 5.6%, more preferably no more than about 5.5%, more preferably no more than about 5.4%, more preferably no more than about 5.3%, more preferably no more than about 5.2%, more preferably no more than about 5.1%, and most preferably no more than about 5%.

In some embodiments, the concentration of impurities present in the composition after a certain period of shelf life may be attributed at least partially to degradation of components of the composition. In some embodiments, the concentration of impurities present in the composition at the end of shelf life may be attributed at least partially to epinephrine degradation. In some embodiments, epinephrine degradation may be a result of physical or chemical stress. Examples of stresses include, but are not limited to, oxygen, pH, bisulfite, light, process surface compatibility, and soluble trace metals.

In some embodiments, components of the composition may be present at a concentration that lowers the amount of impurities after a certain period of shelf life that would otherwise be present in the absence of the components. In some embodiments, components of the composition may be present at a concentration that at least partially inhibits formation of impurities in the composition.

The present invention provides for a composition that may have a low level of D-epinephrine.

In some embodiments, the concentration of D-epinephrine in the composition after a certain period of shelf life may be no more than about 9.5%, preferably no more than about 9%, more preferably no more than about 8.5%, more preferably no more than about 8%, more preferably no more than about 7.5%, more preferably no more than about 7%, more preferably no more than about 6.5%, more preferably no more than about 6%, more preferably no more than about 5.5%, more preferably no more than about 5%, more preferably no more than about 4.5%, more preferably no more than about 4%, more preferably no more than about 3.5%, more preferably no more than about 3%, more preferably no more than about 2.5%, more preferably no more than about 2%, more preferably no more than about 1.5%, more preferably no more than about 1%, and most preferably no more than about 0.5%.

In some embodiments, the concentration of D-epinephrine in the composition after a period of shelf life may be no more than about 9.5%, preferably no more than about 9.4%, more preferably no more than about 9.3%, more preferably no more than about 9.2%, more preferably no more than about 9.1%, more preferably no more than about 9%, more preferably no more than about 8.9%, more preferably no more than about 8.8%, more preferably no more than about 8.7%, more preferably no more than about 8.6%, more preferably no more than about 8.5%, more preferably no more than about 8.4%, more preferably no more than about 8.3%, more preferably no more than about 8.2%, more preferably no more than about 8.1%, more preferably no more than about 8%, more preferably no more than about 7.9%, more preferably no more than about 7.8%, more preferably no more than about 7.7%, more preferably no more than about 7.6%, more preferably no more than about 7.5%, more preferably no more

than about 7.4%, more preferably no more than about 7.3%, more preferably no more than about 7.2%, more preferably no more than about 7.1%, more preferably no more than about 7%, more preferably no more than about 6.9%, more preferably no more than about 6.8%, more preferably no more than about 6.7%, more preferably no more than about 6.6%, more preferably no more than about 6.5%, more preferably no more than about 6.4%, more preferably no more than about 6.3%, more preferably no more than about 6.2%, more preferably no more than about 6.1%, more preferably no more than about 6%, more preferably no more than about 5.9%, more preferably no more than about 5.8%, more preferably no more than about 5.7%, more preferably no more than about 5.6%, more preferably no more than about 5.5%, more preferably no more than about 5.4%, more preferably no more than about 5.3%, more preferably no more than about 5.2%, more preferably no more than about 5.1%, more preferably no more than about 5%, more preferably no more than about 4.9%, more preferably no more than about 4.8%, more preferably no more than about 4.7%, more preferably no more than about 4.6%, more preferably no more than about 4.5%, more preferably no more than about 4.4%, more preferably no more than about 4.3%, more preferably no more than about 4.2%, more preferably no more than about 4.1%, more preferably no more than about 4%, more preferably no more than about 3.9%, more preferably no more than about 3.8%, more preferably no more than about 3.7%, more preferably no more than about 3.6%, more preferably no more than about 3.5%, more preferably no more than about 3.4%, more preferably no more than about 3.3%, more preferably no more than about 3.2%, more preferably no more than about 3.1%, more preferably no more than about 3%, more preferably no more than about 2.9%, more preferably no more than about 2.8%, more preferably no more than about 2.7%, more preferably no more than about 2.6%, more preferably no more than about 2.5%, more preferably no more than about 2.4%, more preferably no more than about 2.3%, more preferably no more than about 2.2%, more preferably no more than about 2.1%, more preferably no more than about 2%, more preferably no more than about 1.9%, more preferably no more than about 1.8%, more preferably no more than about 1.7%, more preferably no more than about 1.6%, more preferably no more than about 1.5%, more preferably no more than about 1.4%, more preferably no more than about 1.3%, more preferably no more than about 1.2%, more preferably no more than about 1.1%, more preferably no more than about 1%, more preferably no more than about 0.9%, more preferably no more than about 0.8%, more preferably no more than about 0.7%, more preferably no more than about 0.6%, and most preferably no more than about 0.5%.

In some embodiments, the initial concentration of D-epinephrine in the composition may be no more than about 2.5%, preferably no more than about 2%, more preferably no more than about 1.5%, more preferably no more than about 1%, and most preferably no more than about 0.5%.

In some embodiments, components of the composition may be present at concentrations that reduce the formation of D-epinephrine that would otherwise occur in the absence of the components. In some embodiments, components of the composition may be present at concentrations that reduce D-epinephrine formation by at least about 15%, more preferably at least about 33%, and most preferably at least about 50%.

In some embodiments, components of the composition may be present at a concentration that reduces the rate and/or extent of D-epinephrine formation after a certain period of shelf life. In some embodiments, components of the composition may reduce D-epinephrine formation by raising the initial pH of the composition and/or by increasing the pH range of the composition over shelf life. In some embodiments, the pH of the composition may be raised at least partially by the pH raising agent. Preferably, the raised pH of the composition does not result in large increases of other degradants of epinephrine.

The present invention provides for a composition that may have a low level of epinephrine sulfonic acid (ESA). In some embodiments, the concentration of ESA in the composition after a certain period of shelf life may be no more than about 14.5%, preferably no more than about 14%, more preferably no more than about 13.5%, more preferably no more than about 13%, more preferably no more than about 12.5%, more preferably no more than about 12%, more preferably no more than about 11.5%, more preferably no more than about 11%, more preferably no more than about 10.5%, more preferably no more than about 10%, more preferably no more than about 9.5%, more preferably no more than about 9%, more preferably no more than about 8.5%, more preferably no more than about 8%, more preferably no more than about 7.5%, more preferably no more than about 7%, more preferably no more than about 6.5%, more preferably no more than about 6%, and most preferably no more than about 5.5%.

In some embodiments, the concentration of ESA in the composition after a certain period of shelf life may be no more than about 14.5%, preferably no more than about 14.4%, more preferably no more than about 14.3%, more preferably no more than about 14.2%, more preferably no more than about 14.1%, more preferably no more than about 14%, more preferably no more than about 13.9%, more preferably no more than about 13.8%, more preferably no more than about 13.7%, more preferably no more than about 13.6%, more preferably no more than about 13.5%, more preferably no more than about 13.4%, more preferably no more than about 13.3%, more preferably no more than about 13.2%, more preferably no more than about 13.1%, more preferably no more than about 13%, more preferably no more than about 12.9%, more preferably no more than about 12.8%, more preferably no more than about 12.7%, more preferably no more than about 12.6%, more preferably no more than about 12.5%, more preferably no more than about 12.4%, more preferably no more than about 12.3%, more preferably no more than about 12.2%, more preferably no more than about 12.1%, more preferably no more than about 12%, more preferably no more than about 11.9%, more preferably no more than about 11.8%, more preferably no more than about 11.7%, more preferably no more than about 11.6%, more preferably no more than about 11.5%, more preferably no more than about 11.4%, more preferably no more than about 11.3%, more preferably no more than about 11.2%, more preferably no more than about 11.1%, more preferably no more than about 11%, more preferably no more than about 10.9%, more preferably no more than about 10.8%, more preferably no more than about 10.7%, more preferably no more than about 10.6%, more preferably no more than about 10.5%, more preferably no more than about 10.4%, more preferably no more than about 10.3%, more preferably no more than about 10.2%, more preferably no more than about 10.1%, more preferably no more than about 10%, more preferably no more than about 9.9%, more preferably no more than about 9.8%, more preferably no more than about 9.7%, more preferably no more than about 9.6%, more preferably no more than about 9.5%, more preferably no more than about 9.4%, more preferably no more than about 9.3%, more preferably no more than about 9.2%, more preferably no more than about 9.1%, more preferably no more than about 9%,

more preferably no more than about 8.9%, more preferably no more than about 8.8%, more preferably no more than about 8.7%, more preferably no more than about 8.6%, more preferably no more than about 8.5%, more preferably no more than about 8.4%, more preferably no more than about 8.3%, more preferably no more than about 8.2%, more preferably no more than about 8.1%, more preferably no more than about 8%, more preferably no more than about 7.9%, more preferably no more than about 7.8%, more preferably no more than about 7.7%, more preferably no more than about 7.6%, more preferably no more than about 7.5%, more preferably no more than about 7.4%, more preferably no more than about 7.3%, more preferably no more than about 7.2%, more preferably no more than about 7.1%, more preferably no more than about 7%, more preferably no more than about 6.9%, more preferably no more than about 6.8%, more preferably no more than about 6.7%, more preferably no more than about 6.6%, more preferably no more than about 6.5%, more preferably no more than about 6.4%, more preferably no more than about 6.3%, more preferably no more than about 6.2%, more preferably no more than about 6.1%, more preferably no more than about 6%, more preferably no more than about 5.9%, more preferably no more than about 5.8%, more preferably no more than about 5.7%, more preferably no more than about 5.6%, and most preferably no more than about 5.5%.

In some embodiments, the initial concentration of ESA in the composition may be no more than about 0.5%, preferably no more than about 0.2%, more preferably no more than about 0.1%, more preferably no more than about 0.05%, and most preferably no more than about 0.025%.

In some embodiments, ESA formation may be influenced by an oxygen-dependent mechanism such that reducing oxygen accessible to the composition may reduce the rate of ESA formation. In some embodiments, oxygen present in the headspace of a vial containing the composition may be reduced by replacing some or all of the oxygen with a gas other than oxygen, preferably an inert gas, thereby at least partially reducing the rate of ESA production. In some embodiments, some or all of the oxygen present in the headspace of a vial containing the composition may be replaced with nitrogen and/or argon.

In some embodiments, the headspace gas of the composition is manipulated such that degradation of components in the composition is minimized. The term "headspace" refers to the gas space above the product in a container. The headspace gas may be manipulated in order to reduce the amount of oxygen present therein. In some embodiments, the amount of oxygen in the headspace gas is no more than about 15% v/v of the total gas, preferably no more than about 13%, more preferably no more than about 10%, more preferably no more than about 5%, more preferably no more than about 2.5%, more preferably no more than about 1%, and most preferably about 0%.

In some embodiments of the present invention, the concentrations of certain components of the composition may be reduced such that the concentration of ESA in the composition after a period of shelf life is reduced. In some embodiments, the concentration of ESA present in the composition after a period of shelf life is reduced at least partially by reducing the initial concentration of antioxidant in the composition. In some embodiments, the concentrations of certain components of the composition, such as initial concentration of antioxidant, are reduced such that the rate of ESA production is reduced by at least about 25%, more preferably at least about 50%, and most preferably at least about 75% after a certain period of shelf life, as compared to a composition in which the certain components are not present.

The present invention provides for a composition that may have a low level of oxidative degradants. The term "oxidative degradant" refers to any impurity that may be at least partially attributed to an oxidation reaction involving one or more components of the composition. In some embodiments, the oxidative degradants may be formed via oxidation of epinephrine. Examples of oxidative degradants include, but are not limited to, adrenochrome, adrenolutin, melanins, and analogs thereof.

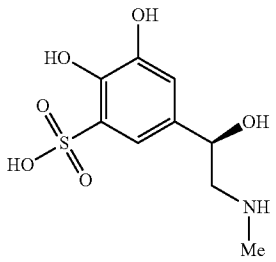
In some embodiments, the concentration of oxidative degradants in the composition after a certain period of shelf life may be no more than about 1')/0, preferably no more than about 0.1%, more preferably no more than about 0.05%, more preferably no more than about 0.04%, more preferably no more than about 0.03%, more preferably no more than about 0.02%, and most preferably no more than about 0.01%, after a certain period of shelf life.

In some embodiments, the concentration of oxidative degradants present in the composition after a certain period of shelf life may be such that the composition does not undergo a physical change. Examples of physical change include, but are not limited to, color change and insoluble particle formation.

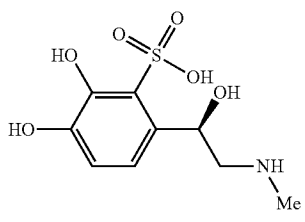
In some embodiments, the rate of formation and/or the concentration of oxidative degradants in the composition may be reduced after a certain period of shelf life by other components of the composition. In some embodiments, the rate of formation and/or the concentration of oxidative degradants in the composition may be reduced by the antioxidant. In some embodiments, the rate of formation and/or the concentration of oxidative degradants in the composition may be reduced by reducing the amount of oxygen accessible to the composition. In some embodiments, the rate of formation and/or the concentration of oxidative degradants in the composition may be reduced by replacing some or all of the oxygen in the headspace of a vial containing the composition with non-oxygen gas, preferably an inert gas such as nitrogen and/or argon.

In some embodiments, the present invention may have low levels of degradants Impurity A, Impurity B, and/or Unknown C.

In some embodiments, Impurity A may be a compound with the following structure:



In some embodiments, Impurity B may be a compound with the following structure:



In some embodiments, Unknown C may be characterized by a λ_{max} of about 380 nm.

In some embodiments, Unknown C may be characterized by its elution peak using HILIC (Hydrophilic Interaction Liquid Chromatography), which differs from one substance to another.

In some embodiments, Unknown C may be characterized using an isocratic HILIC separation of mixtures according to the conditions described in Tables 1-3.

Table 1 lists the compositions of the mobile phases that may be used for isocratic HILIC separations.

TABLE 1

C.omposition of Isocratic Mobile Phases	
Mobile Phase A	100 mL Ammonium Formate Buffer 900 mL Acetonitrile
Mobile Phase B	100 mL Ammonium Formate Buffer 400 mL Water 500 mL Acetonitrile

The Ammonium Formate Buffer of Table 1 may be prepared as follows: 1.5 g of Sodium Chloride, 5.0 mL of Formic Acid, and 3.0 mL of 6N Ammonium Hydroxide is added to 1.0 L of water. The solution may be vacuum filtered through a 0.45 μm nylon membrane. The preparation may be scaled up where necessary.

Table 2 lists different conditions that may be used for isocratic HILIC separations.

TABLE 2

Isocratic Mobile Phases for HILIC Separation		
Isocratic Water %	Mobile Phase A %	Mobile Phase B %
15	87.5	12.5
18	80	20
22	70	30

An Epinephrine HILIC Impurities Marker Solution (Epi-HILIC IMS) may be prepared by first preparing an Epinephrine/Degradant Bulk Solution as follows: In a clean, clear, 2 L glass bottle, dissolving sodium chloride (6.147 g) and tartaric acid (2.251 g) in about 800 mL of water, adding sodium hydroxide 5.0N (6.25 mL) to the solution and mixing, adding sodium metabisulfite (1.425 g) to the solution and mixing to dissolve, adding epinephrine (1.1334 g) as a solution in HCl 1.0N (6.6 mL) to the solution, and then adding water to a final solution weight of 1005.9, and mixing thoroughly. The Epinephrine/Degradant Bulk Solution may then be allowed to sit in a capped bottle in the hood, under fluorescent light with a light exposure at about 1000 lux, for 12 days with lights continuously on.

The Epinephrine HILIC Impurities Marker Solution (Epi-HILIC IMS) may then be prepared in a 500 mL clear glass bottle as follows: adding Epinephrine/Degradant Bulk Solution (500 mL), adding HCl 1.0 N (6.0 mL) and then mixing (with a final pH at 3.2), adding ESA (9.5 mg) and mixing to dissolve, adding adrenochrome (5.6 mg) and mixing to dissolve, preparing adrenalone stock mixture by withdrawing 10 mL of the solution then adding and dissolving adrenalone HCl (4.7 mg), adding adrenalone stock mixture (0.8 mL) back into the bulk mixture, and mixing thoroughly.

An Epinephrine HILIC Impurities Marker Solution (Epi-HILIC IMS) which comprises Unknown C may be analyzed using the conditions listed in Table 3.

TABLE 3

Chromatographic Conditions for isocratic HILIC Separation	
Column	SeQuant ZIC HILIC PEEK, 150 × 4.6 mm, 3.5 μm particle size, 100 Å pore size
Flow Rate	1 mL/min
Injection Volume	25 μL
Column Temperature	35° C.
Sample preparation	Dilute exactly 1 volume of sample (nominal strength of 1 mg/mL epinephrine) with exactly 3 volumes of acetonitrile.
Detector	Signal-280 nm, Bandwidth-10 nm; Reference-Off Signal-346 nm, Bandwidth-10 nm; Reference-Off Signal-380 nm, Bandwidth-10 nm; Reference-Off Signal-292 nm, Bandwidth-10 nm; Reference-Off
Run Time	35 minutes
Data Acquisition	Integrate impurities between 0 and 30 minutes

Tables 4 lists the relevant characteristic peaks of isocratic HILIC separation according to the above specifications at a detection wavelength of 346 nm using the 15% isocratic water preparation according to Table 2.

TABLE 4

Chromatography of the Impurities Marker Solution using isocratic HILIC with 15% water and 346 nM Detection		
	Time (Minutes)	Absorbance (AU)
Unknown C	approx. 21	approx. 0.001

Tables 5 lists the relevant characteristic peaks of isocratic HILIC separation according to the above specifications at a detection wavelength of 346 nm using the 18% isocratic water preparation according to Table 2.

TABLE 5

Chromatography of the Impurities Marker Solution using isocratic HILIC with 18% water and 346 nM Detection		
	Time (Minutes)	Absorbance (AU)
Unknown C	approx. 14	approx. 0.002

Table 6 lists the relevant characteristic peaks of isocratic HILIC separation according to the above specifications at a detection wavelength of 346 nm using the 22% isocratic water preparation according to Table 2.

TABLE 6

Chromatography of the Impurities Marker Solution using isocratic HILIC with 22% water and 346 nM Detection		
	Time (Minutes)	Absorbance (AU)
Unknown C	approx. 8.5	approx. 0.002

The chromatography outputs of the Impurities Marker Solution using isocratic HILIC as described is also shown in FIG. **1** (15% water), FIG. **2** (18% water), and FIG. **3** (22% water).

In some embodiments, Unknown C may be characterized using a gradient HILIC method. An Epinephrine HILIC

Impurities Marker Solution (EpiHILIC IMS) which comprises Unknown C may be analyzed using the conditions listed in Table 7 and 8.

Table 7 lists the compositions of the mobile phases that may be used for gradient HILIC separations.

TABLE 7

Composition of Gradient Mobile Phases	
Mobile Phase A	100 mL Ammonium Formate Buffer 900 mL Acetonitrile
Mobile Phase A	100 mL Ammonium Formate Buffer 400 mL Water 500 mL Acetonitrile

Table 8 lists the solvent program for the gradient HILIC method.

TABLE 8

Solvent program for the gradient HILIC method.

		Mobile Phase Composition		
Time (min)	Flow (mL/min)	Water %	A%	B%
Initial	1.0	15.2	87	13
12	1.0	15.2	87	13
22	1.0	22	70	30
25	1.0	22	70	30
28	1.0	15.2	87	13
35	1.0	15.2	87	13

The chromatographic conditions for the gradient HILIC are the same as those listed in Table 3.

The chromatography outputs of the Impurities Marker Solution using gradient HILIC according to the above specifications at detection wavelengths of 280 nm, 292 nm, 346 nm, and 380 nm are shown in FIG. **4**.

In some embodiments, the concentration Impurity A, Impurity B, and Unknown C together in the composition after a certain period of shelf life is no more than about 5%, preferably no more than about 4%, more preferably no more than about 3%, more preferably no more than about 2%, more preferably no more than about 1%, and most preferably no more than about 0.5%.

In some embodiments, the concentration of Impurity A in the composition after a certain period of shelf life may be no more than about 2%, preferably no more than about 1.9%, more preferably no more than about 1.8%, more preferably no more than about 1.7%, more preferably no more than about 1.6%, more preferably no more than about 1.5%, more preferably no more than about 1.4%, more preferably no more than about 1.3%, more preferably no more than about 1.2%, more preferably no more than about 1.1%, more preferably no more than about 1%, more preferably no more than about 0.9%, more preferably no more than about 0.8%, more preferably no more than about 0.7%, more preferably no more than about 0.6%, more preferably no more than about 0.5%, more preferably no more than about 0.4%, more preferably no more than about 0.3%, more preferably no more than about 0.2%, and most preferably no more than about 0.1%.

In some embodiments, the concentration of Impurity B in the composition after a certain period of shelf life may be no more than about 2%, preferably no more than about 1.9%, more preferably no more than about 1.8%, more preferably no more than about 1.7%, more preferably no more than about 1.6%, more preferably no more than about 1.5%, more preferably no more than about 1.4%, more preferably no more than about 1.3%, more preferably no more than about 1.2%, more preferably no more than about 1.1%, more preferably no more than about 1%, more preferably no more than about 0.9%, more preferably no more than about 0.8%, more preferably no more than about 0.7%, more preferably no more than about 0.6%, more preferably no more than about 0.5%, more preferably no more than about 0.4%, more preferably no more than about 0.3%, more preferably no more than about 0.2%, and most preferably no more than about 0.1%.

In some embodiments, the concentration of Unknown C in the composition after a certain period of shelf life may be no more than about 2%, preferably no more than about 1.9%, more preferably no more than about 1.8%, more preferably no more than about 1.7%, more preferably no more than about 1.6%, more preferably no more than about 1.5%, more preferably no more than about 1.4%, more preferably no more than about 1.3%, more preferably no more than about 1.2%, more preferably no more than about 1.1%, more preferably no more than about 1%, more preferably no more than about 0.9%, more preferably no more than about 0.8%, more preferably no more than about 0.7%, more preferably no more than about 0.6%, more preferably no more than about 0.5%, more preferably no more than about 0.4%, more preferably no more than about 0.3%, more preferably no more than about 0.2%, and most preferably no more than about 0.1%.

In some embodiments, the presence of Impurity A, Impurity B, and/or Unknown C in the composition may be at least partially related to the presence of oxygen such that reducing oxygen accessible to the composition may reduce the amount of Impurity A, Impurity B, and/or Unknown C present in the composition. In some embodiments, oxygen present in the headspace of a vial containing the composition may be reduced by replacing some or all of the oxygen a gas other than oxygen, preferably an inert gas, thereby at least partially reducing the amount of Impurity A, Impurity B, and/or Unknown C present in the composition. In some embodiments, some or all of the oxygen present in the headspace of a vial containing the composition may be replaced with nitrogen and/or argon.

In some embodiments, other components of the composition may be present at a concentration that reduces the amount of Impurity A, Impurity B, and/or Unknown C present in the composition after a certain period of shelf life and/or reduces the rate of Impurity A, Impurity B, and/or Unknown C formation. In some embodiments, other components of the composition may reduce the amount of Impurity A, Impurity B, and/or Unknown C present in the composition after a certain period of shelf life by interfering with an interaction involving other components of the composition. In some embodiments, other components of the composition may reduce the amount of Impurity A, Impurity B, and/or Unknown C present in the composition after a certain period of shelf life by interfering with an oxidative processes involving epinephrine. In some embodiments, other components of the composition may reduce the presence of Impurity A, Impurity B, and/or Unknown C in the composition after a certain period of shelf life by interacting with a trace metal present in the composition. In some embodiments, the transition metal complexing agent may reduce the amount of Impurity A, Impurity B, and/or Unknown C present in the composition after a certain period of shelf life.

The present invention provides for compositions that may have an extended shelf life. As used throughout this application, the term "shelf life" refers to the length of time that a product may be stored without becoming unfit for medical use. Examples of compositions which are unfit for medical use include, but are not limited to, compositions with unac-

ceptably high impurity levels and/or the presence of physical changes described herein, such as color change and/or the presence of insoluble particles.

In some embodiments, the period of shelf life of the composition may be 1 month, preferably 2 months, more preferably 3 months, more preferably 4 months, more preferably 5 months, more preferably 6 months, more preferably 7 months, more preferably 8 months, more preferably 9 months, more preferably 10 months, more preferably 11 months, more 12 months, preferably 13 months, more preferably 14 months, more preferably 15 months, more preferably 16 months, more preferably 17 months, more preferably 18 months, more preferably 19 months, more preferably 20 months, more preferably 21 months, more preferably 22 months, more preferably 23 months, more preferably 24 months, more preferably 25 months, more preferably 26 months, more preferably 27 months, more preferably 28 months, more preferably 29 months, more preferably 30 months, more preferably 31 months, more preferably 32 months, more preferably 33 months, more preferably 34 months, more preferably 35 months, and most preferably 36 months. In some embodiments, the period of shelf life may vary based on product presentation.

In some embodiments, shelf life may be determined by measuring certain characteristics of the composition that may indicate that the composition is unfit for medical use. In some embodiments, shelf life may be determined by measuring the concentration of impurities in the composition after storage at 25° C. and 60% relative humidity. In some embodiments, shelf life may be determined by measuring the concentration of impurities in the composition after storage at 37° C. and 65% relative humidity.

In some embodiments, shelf life may be determined by measuring the concentration of impurities in the composition using the guidelines as outlined in the ICH Harmonised Tripartite Guideline: Stability Testing of New Drug Substances and Products Q1A(R2), dated Feb. 6, 2003, the disclosure of which is incorporated by reference herein in its entirety.

For example, shelf life may be determined for long term, accelerated, and, where appropriate, intermediate storage conditions by measuring the concentration of impurities after storage in the following conditions, wherein the composition is packaged in a container closure system that is the same as or simulates the packaging proposed for storage and distribution.

Study	Storage condition	Minimum time period covered
Long term	25° C. ± 2° C./60% RH ± 5% RH or 30° C. ± 2° C./65% RH ± 5% RH	12 months
Intermediate	30° C. ± 2° C./65% RH ± 5% RH	6 months
Accelerated	40° C. ± 2° C./75% RH ± 5% RH	6 months

In some embodiments, shelf life may be attributed at least in part to the concentration of impurities in the composition such that the reduction of impurity concentration and/or rate of impurity formation lengthens the composition's shelf life.

The present invention provides for compositions that may have an initial pH which at least partially influences any of the mechanisms described herein. In some embodiments, the initial pH of the composition may be such that the rate of component degradation is minimized. For example, the initial pH of the composition may be such that the rate of formation of D-epinephrine is minimized after a certain period of shelf life. In some embodiments, the initial pH range of the composition may be in the range of about 3.5 and 4.5, preferably in the range of about 3.6 and 4.4, more preferably in the range of about 3.7 and 4.3, more preferably in the range of about 3.8 and 4.2, more preferably in the range of about 3.9 and 4.1, and most preferably about 4.0.

In some embodiments, components of the composition may be selected such that the pH of the composition is within a preferred range. For example, in some embodiments, the pH raising agent may be present in the composition such that the pH of the composition is higher than what it would otherwise be without the presence of the pH raising agent.

In some embodiments, the initial pH may be such that the composition conforms to industry requirements, such as the limit on total acidity imposed by the USP 37-NF 32, S2, monograph.

The present invention also provides for compositions that may resist significant pH change after a certain period of shelf life. In some embodiments, the pH range after a certain period of shelf life of the composition may be in the range of about 2.5 and 5, preferably in the range of about 2.6 and 4.9, more preferably in the range of about 2.7 and 4.8, more preferably in the range of about 2.8 and 4.7, more preferably in the range of about 2.9 and 4.6, more preferably in the range of about 3.0 and 4.5, more preferably in the range of about 3.1 and 4.4, more preferably in the range of about 3.2 and 4.3, more preferably in the range of about 3.3 and 4.2, more preferably in the range of about 3.4 and 4.1, and most preferably in the range of about 3.5 and 4.0.

In some embodiments, components of the composition may be selected such that the pH range after a certain period of shelf life of the composition is within a preferred range. For example, in some embodiments, the pH raising agent may be present in the composition such that the pH range after a certain period of shelf life of the composition is higher than what it would otherwise be without the presence of the pH raising agent.

In some embodiments, the pH range after a certain period of shelf life of the composition may be such that the degradation of components of the composition is reduced. In some embodiments, the pH range after a certain period of shelf life of the composition may be such that the formation of D-epinephrine is reduced. In some embodiments, the pH range after a certain period of shelf life of the composition may be such that the amount of D-epinephrine present in the composition is in a preferred range described herein.

In some embodiments, the pH range after a certain period of shelf life may be such that the degradation of the antioxidant is reduced. For example, the conversion of bisulfite to sulfer dioxide may be reduced. The reduction of the conversion of bisulfite to sulfer dioxide may at least in part lead to a higher proportion of antioxidant present in the composition after a certain period of shelf life compared to compositions outside of the preferred pH range.

In some embodiments, the pH range of the composition after a certain period of shelf life does not change significantly from the initial pH of the composition. In some embodiments, the change in pH range may be no more than about 1 unit different than the initial pH of the composition, preferably no more than about 0.9 units, more preferably no more than about 0.8 units, more preferably no more than about 0.7 units, more preferably no more than about 0.6 units, more preferably no more than about 0.5 units, more preferably no more than about 0.4 units, more preferably no more than about 0.3 units, more preferably no more than about 0.2

units, most preferably no more than about 0.1 units. In some embodiments, the pH after a certain period of shelf life may not fall below 3.5.

In some embodiments, the pH range may be such that the composition conforms to the limit on total acidity imposed by the USP 37-NF 32, S2, monograph.

The present invention provides for compositions in single-dose and/or multi-dose formulations. In some embodiments, the composition may be contained in vials. In some embodiments, the vials may comprise clear glass, amber glass, or plastic. In some embodiments, the vials may be in the range of about 0.1 to 500 mL in volume, preferably in the range of about 0.5 to 250 mL, more preferably in the range of about 1 to 100 mL, and most preferably in the range of about 10 to 50 mL. In some embodiments, the composition may exist in a 1 mL vial. In some embodiments, the composition may exist in a 30 mL vial. In some embodiments, the 1 mL vial may be a single-dose formulation. In some embodiments, the 30 mL vial may be a multi-dose formulation. In some embodiments, the same vial may be used for multiple applications of the composition for up to about 10 days after initial use, preferably up to about 15 days, more preferably up to about 30 days, more preferably up to about 45 days, and most preferably up to about 60 days. In some embodiments, the composition may be lyophilized.

In some embodiments, the composition may be contained in an autoinjector.

The present invention also provides for methods of making pharmaceutical compositions of the present invention. In some embodiments of carrying out a method of making the present composition, a bulk solution may be produced as follows: water for injections, whose dissolved oxygen content is in an acceptable range as measured by a WFI USP/EP O_2 probe, may be added to a manufacturing tank kept under nitrogen pressure. Then, a tonicity regulating agent may be added and mixed. Then, a pH raising agent may be added to the solution while mixing. Then, a metal complexing agent may then be added to the solution while mixing. An antioxidant may then be added while mixing.

In another container equipped with a stir bar, a pH lowering agent may be combined with an active agent. The pH lowering agent and the active agent together may then be stirred using the stir bar in the separate container before the mixture is added to the manufacturing tank under nitrogen.

Then, the separate container may be rinsed with water for injections, whose dissolved oxygen content is in an acceptable range as measured by a WFI USP/EP 0_2 probe, using a pipet and added to the manufacturing tank. This rinsing step may be repeated 1 to 3 more times. The solution may then mix before the final net weight of the solution is adjusted using water for injections.

The present invention also provides for methods of treating or reducing the symptoms associated with a medical condition, comprising administering to a subject in need thereof the pharmaceutical composition of the present invention.

Examples of conditions to be treated comprise bronchospasm, sensitivity reactions, cardiac arrhythmias, GI and renal hemorrhage, superficial bleeding, premature labor, hypoglycemia, and cardiogenic, hemorrhagic, and traumatic shock. In some embodiments, the present invention provides for methods for reducing the symptoms associated with allergic reactions (Type 1), including anaphylaxis, and/or for the induction and maintenance of mydriasis during intraocular surgery.

Examples of methods of administration comprise subcutaneous, intracameral, intravenous, and intramuscular injection, infusion, intra-arterial administration, intracardiac injection, endotracheal administration, intraosseous administration, oral inhalation, topical administration, and as ophthalmic irrigation.

Unless otherwise noted, all concentrations herein (other than percentage of impurities) are expressed as weight/volume percent (w/v %) of the composition.

The present invention is further described by way of the following non-limiting Examples that are given for illustrative purposes only.

Examples 1-18 represent example compositions according to the present invention.

Example 1

Ingredient	Concentration (mM)
Epinephrine	1-10
Tonicity regulating agent	75-150
Antioxidant	1-10
pH lowering agent	2-11
Transition metal complexing agent	0.1-15
Water	Fill to final total volume

Example 2

Ingredient	Concentration (mM)
Epinephrine	4-8
Tonicity regulating agent	90-140
Antioxidant	2-6
pH lowering agent	4-8
Transition metal complexing agent	0.2-2
Water	Fill to final total volume

Example 3

Ingredient	Concentration (mM)
Epinephrine	1-10
Sodium Chloride	75-150
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	2-11
Tetraethylenepentamine	0.1-15
Water	Fill to final total volume

Example 4

Ingredient	Concentration (mM)
Epinephrine	1-10
Sodium Chloride	75-150
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	2-11
Disodium Edetate Dihydrate	0.1-15
Water	Fill to final total volume

Example 5

Ingredient	Concentration (mM)
Epinephrine	1-10
Tonicity regulating agent	75-150
pH raising agent	10-70
Antioxidant	1-10
pH lowering agent	2-11
Water	Fill to final total volume

Example 6

Ingredient	Concentration (mM)
Epinephrine	4-8
Tonicity regulating agent	90-140
pH raising agent	30-50
Antioxidant	2-6
pH lowering agent	4-8
Water	Fill to final total volume

Example 7

Ingredient	Concentration (mM)
Epinephrine	3-11
Sodium Chloride	80-160
Tartaric Acid	7-21
Sodium Hydroxide	15-30
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	1-10
Water	Fill to final total volume

Example 8

Ingredient	Concentration (mg/mL)
Epinephrine	1-9
Sodium Chloride	1-10
Tartaric Acid	2-15
Sodium Hydroxide	1-5
Sodium Metabisulfite	1-12
Hydrochloric Acid 4% Solution	0-6 (mL/mL)
Water	Fill to final total volume

Example 9

Ingredient	Concentration (mM)
Epinephrine	1-15
Sodium Chloride	75-150
Lactic Acid	5-25
Sodium Hydroxide	15-30
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	1-10
Water	Fill to final total volume

Example 10

Ingredient	Concentration (mM)
Epinephrine	1-10
Tonicity regulating agent	75-150
pH raising agent	10-70
Antioxidant	1-10
pH lowering agent	2-11
Transition metal complexing agent	0.1-15
Water	Fill to final total volume

Example 11

Ingredient	Concentration (mM)
Epinephrine	4-8
Tonicity regulating agent	90-140
pH raising agent	30-50
Antioxidant	2-6
pH lowering agent	4-8
Transition metal complexing agent	0.2-2
Water	Fill to final total volume

Example 12

Ingredient	Concentration (mM)
Epinephrine	3-11
Sodium Chloride	80-160
Tartaric Acid	7-21
Sodium Hydroxide	15-30
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	1-10
Disodium Edetate Dihydrate	0-5
Water	Fill to final total volume

Example 13

Ingredient	Concentration (mM)
Epinephrine	1-15
Sodium Chloride	75-150
Lactic Acid	5-25
Sodium Hydroxide	15-30
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	1-10
Disodium Edetate Dihydrate	0.5-8.5
Water	Fill to final total volume

Example 14

Ingredient	Concentration (mM)
Epinephrine	1-15
Sodium Chloride	50-150
Tartaric Acid	5-20
Sodium Hydroxide	15-30
Sodium Metabisulfite	3-18
Hydrochloric Acid 4% Solution	1-10

-continued

Ingredient	Concentration (mM)
Tetraethylenepentamine	0.5-10.5
Water	Fill to final total volume

Example 15

Ingredient	Concentration (mM)
Epinephrine	1-10
Tonicity regulating agent	75-150
pH raising agent	10-70
Antioxidant	1-10
Preservative	10-50
pH lowering agent	2-11
Transition metal complexing agent	0.1-15
Water	Fill to final total volume

Example 16

Ingredient	Concentration (mM)
Epinephrine	4-8
Tonicity regulating agent	90-140
pH raising agent	30-50
Antioxidant	2-6
Preservative	20-40
pH lowering agent	4-8
Transition metal complexing agent	0.2-2
Water	Fill to final total volume

Example 17

Ingredient	Concentration (mg/mL)
Epinephrine	1-10
Sodium Chloride	4-12
Lactic Acid	0.5-15
Sodium Hydroxide	1-5
Sodium Metabisulfite	0.1-10.1
Chlorobutanol, hydrous	3-12
Hydrochloric Acid 4% Solution	0.1-5 (mL/mL)
Disodium Edetate Dihydrate	1-15
Water	Fill to final total volume

Example 18

Ingredient	Concentration (mM)
Epinephrine	1-15
Sodium Chloride	50-150
Tartaric Acid	5-20
Sodium Hydroxide	15-30
Sodium Metabisulfite	3-18
Chlorobutanol, hydrous	10-30
Hydrochloric Acid 4% Solution	1-10
Tetraethylenepentamine	0.5-10.5
Water	Fill to final total volume

What is claimed is:

1. A composition comprising:

in the range of about 0.5 to 1.5 mg/mL of epinephrine and/or salts thereof,

in the range of about 6 to 8 mg/mL of a tonicity regulating agent,

in the range of about 2.8 to 3.8 mg/mL of a pH raising agent,

in the range of about 0.1 to 1.1 mg/mL of an antioxidant,

in the range of about 0.001 to 0.010 mL/mL of a pH lowering agent, and

in the range of about 0.01 to 0.4 mg/mL of a transition metal complexing agent,

wherein the antioxidant comprises sodium bisulfite and/or sodium metabisulfite.

2. The composition of claim **1**, wherein the tonicity regulating agent comprises sodium chloride.

3. The composition of claim **1**, wherein the pH raising agent comprises a buffer system comprising at least two compounds.

4. The composition of claim **1**, wherein the pH raising agent comprises at least one of tartaric acid and sodium hydroxide.

5. The composition of claim **1**, wherein the pH lowering agent comprises hydrochloric acid.

6. The composition of claim **1**, wherein the transition metal complexing agent comprises EDTA.

7. The composition of claim **1**, further comprising a preservative.

8. The composition of claim **7**, wherein the preservative comprises chlorobutanol.

9. The composition of claim **8**, wherein the preservative is present at a concentration of in the range of about 4.75 to 5.75 mg/mL.

10. The composition of claim **1**, further comprising a solvent.

11. The composition of claim **10**, wherein the solvent comprises water.

12. The composition according to claim **1**, wherein the composition comprises about 17% or less total impurities after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH,

wherein the impurities comprise epinephrine sulfonic acid (ESA), D-epinephrine, Impurity A, Impurity B, and Unknown C.

13. The composition according to claim **1**, wherein the composition comprises about 16% or less total impurities after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH,

wherein the impurities comprise epinephrine sulfonic acid (ESA), D-epinephrine, Impurity A, Impurity B, and Unknown C.

14. The composition of claim **1**, wherein the composition comprises about 11% or less of ESA after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

15. The composition of claim **1**, wherein the composition comprises about 3% or less of D-Epinephrine after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

16. The composition of claim **1**, wherein the composition comprises about 1% or less of Impurity A after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

17. The composition of claim **1**, wherein the composition comprises about 1% or less of Impurity B after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

18. The composition of claim **1**, wherein the composition comprises about 1% or less of Unknown C after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

19. The composition of claim **1**, wherein the composition does not undergo unacceptable color change after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

EPINEPHRINE FORMULATIONS

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a Continuation of U.S. patent application Ser. No. 14/657,990, filed Mar. 13, 2015. The disclosure of the prior application is hereby incorporated in its entirety by reference.

FIELD OF THE INVENTION

The present invention provides pharmaceutical compositions comprising epinephrine, methods of administration, and methods of making the same.

BACKGROUND

Epinephrine, also known as 4-[(1R)-1-Hydroxy-2-(methylamino)ethyl]-1,2-benzenediol, is the active principle of the adrenal medulla and an endogenous catecholamine which acts directly on both alpha and beta adrenergic receptors. When used in pharmaceutical compositions, epinephrine can act as a non-selective alpha and beta adrenergic agonist and can work rapidly to improve breathing, stimulate the heart, raise dropping blood pressure, reverse hives, and reduce swelling of the face, lips, and throat. Uses for epinephrine include emergency treatment of allergic reactions (Type 1), including anaphylaxis, induction and maintenance of mydriasis during intraocular surgery, treatment of bronchospasm, sensitivity reactions, cardiac arrhythmias, GI and renal hemorrhage, superficial bleeding, premature labor, hypoglycemia, and cardiogenic, hemorrhagic, and traumatic shock. Epinephrine can also be used to increase blood flow in ACLS during CPR, as an adjunct to local anesthesia, and for radiographic uses.

One example of a pharmaceutical composition with epinephrine as an active agent is Adrenalin®, a sympathomimetic agent manufactured and distributed by Par Sterile Products, LLC. Adrenalin® is an epinephrine injection suitable for subcutaneous, intracameral, and intramuscular administration. When diluted, it may also be administered as ophthalmic irrigation or intracameral injection. Adrenalin® is used primarily as an emergency treatment of allergic reactions (Type 1), including anaphylaxis, and for induction and maintenance of mydriasis during intraocular surgery.

Adrenalin® is a clear, colorless solution containing 1 mg/mL epinephrine in a clear glass vial. Adrenalin® is currently available in 1 mL single-dose and 30 mL multi-dose formulations. For the 1 mL product, each 1 mL of Adrenalin® contains 1 mg epinephrine, 9.0 mg sodium chloride, 1.0 mg sodium metabisulfite, hydrochloric acid to adjust pH, and water for injection. For the 30 mL product, each 1 mL of Adrenalin® solution contains 1 mg epinephrine, 9.0 mg sodium chloride, 1.5 mg sodium metabisulfite, hydrochloric acid to adjust pH, 5.4 mg chlorobutanol as a preservative and water for injection. The pH range of Adrenalin® is 2.2-5.0.

Adrenalin® 1 mL is FDA approved for an 18 month shelf life. The Adrenalin® 30 mL product is approved for an even shorter shelf life of 14 months. Shelf life is limited by the formation of degradants, which mainly comprise epinephrine sulfonic acid (ESA) and D-epinephrine, an enantiomer of L-epinephrine that has insignificant therapeutic activity. The currently approved Adrenalin® 1 mL product has a total impurity limit of ≤20%. Adrenalin® 1 mL has a concentration limit of ≤13.5% ESA and ≤9.5% D-epinephrine. The currently approved Adrenalin® 30 mL product has a total impurity limit of ≤20%. Adrenalin®30 mL has a concentration limit of ≤14.5% ESA and ≤9.5% D-epinephrine.

There is currently a need in the art for improved epinephrine-containing pharmaceuticals. It is an object of the present invention to provide an epinephrine-containing pharmaceutical composition that addresses some of the limitations of present formulations.

SUMMARY OF THE INVENTION

The present invention provides a pharmaceutical composition comprising epinephrine. The composition may be useful for emergency treatment of allergic reactions (Type 1), including anaphylaxis, induction and maintenance of mydriasis during intraocular surgery, treatment of bronchospasm, sensitivity reactions, cardiac arrhythmias, GI and renal hemorrhage, superficial bleeding, premature labor, hypoglycemia, and cardiogenic, hemorrhagic, and traumatic shock. The composition may also be used to increase blood flow in ACLS during CPR, as an adjunct to local anesthesia, and for radiographic uses. The composition may be administrable via subcutaneous, intracameral, intravenous, and intramuscular injection, infusion, intra-arterial administration, intracardiac injection, endotracheal administration, intraosseous administration, oral inhalation, topical administration, and as ophthalmic irrigation.

The present invention also provides for a composition comprising at least one of an active agent, a pH raising agent, an antioxidant, a transition metal complexing agent, a pH lowering agent, a tonicity regulating agent, optionally a preservative, and optionally a solvent.

The present invention also provides for compositions with low levels of D-epinephrine.

The present invention also provides for compositions with low levels of epinephrine sulfonic acid (ESA).

The present invention also provides for compositions with low levels of oxidative degradants.

The present invention also provides for compositions with low levels of total impurities.

The present invention also provides for compositions comprising a pH raising agent.

The present invention also provides for compositions comprising an antioxidant.

The present invention also provides for compositions that may resist significant pH change over shelf life.

The present invention also provides for a method of making such compositions.

The present invention also provides for a method of treating a medical condition comprising administering to a subject in need thereof a composition of the present invention.

BRIEF DESCRIPTION OF THE FIGURES

FIG. **1** is a chromatogram of the Impurities Marker Solution using isocratic HILIC with 15% water.

FIG. **2** is a chromatogram of the Impurities Marker Solution using isocratic HILIC with 18% water.

FIG. **3** is a chromatogram of the Impurities Marker Solution using isocratic HILIC with 22% water.

FIG. **4** is a chromatogram of the Impurities Marker Solution using gradient HILIC separation.

DETAILED DESCRIPTION OF THE INVENTION

The present invention provides a pharmaceutical composition comprising epinephrine. The composition may be useful for emergency treatment of allergic reactions (Type 1),

including anaphylaxis, induction and maintenance of mydriasis during intraocular surgery, treatment of bronchospasm, sensitivity reactions, cardiac arrhythmias, GI and renal hemorrhage, superficial bleeding, premature labor, hypoglycemia, and cardiogenic, hemorrhagic, and traumatic shock. The composition may also be used to increase blood flow in ACLS during CPR, as an adjunct to local anesthesia, and for radiographic uses. The composition may be administrable via subcutaneous, intracameral, intravenous, and intramuscular injection, infusion, intra-arterial administration, intracardiac injection, endotracheal administration, intraosseous administration, oral inhalation, topical administration, and as ophthalmic irrigation.

The present invention provides for a composition comprising at least one of an active agent, a pH raising agent, an antioxidant, a transition metal complexing agent, a pH lowering agent, a tonicity regulating agent, optionally a preservative, and optionally a solvent.

In some preferred embodiments, the composition may comprise an active agent, a pH raising agent, an antioxidant, a pH lowering agent, and a tonicity regulating agent. In some preferred embodiments, the composition may comprise an active agent, an antioxidant, and a tonicity regulating agent. In some preferred embodiments, the composition may comprise an active agent, a transition metal complexing agent, a pH raising agent, a pH lowering agent, and a tonicity regulating agent. In some preferred embodiments, the composition may comprise an active agent, a transition metal complexing agent, an antioxidant, and a tonicity regulating agent. In some preferred embodiments, the composition may comprise an active agent, a pH raising agent, a pH lowering agent, and a tonicity regulating agent. One of ordinary skill will appreciate that the combination of components in the composition may be varied in order to obtain compositions with desired properties.

In some embodiments, the active agent comprises epinephrine and/or salts thereof. Examples of epinephrine salts include, but are not limited to, acetate, carbonate, citrate, hydrochloride, hydrocyanide, hydrofluoride, nitrate, nitrite, phosphate, and sulfate salts. Preferably, the salt is a hydrochloride salt.

In some embodiments, the active agent is present at a concentration sufficient for any of the uses described herein. In some embodiments, the active agent is present at a concentration of about 0.1 to 2 mg/mL, preferably about 0.5 to 1.5 mg/mL, more preferably about 0.75 to 1.25 mg/mL, and most preferably about 1 mg/mL. In some embodiments, the active agent is present at a concentration of 1.14 mg/mL.

The present invention provides for a composition that may comprise at least one pH raising agent in an amount that raises the pH of the composition. In some embodiments, the pH raising agent comprises a buffer system. The term "buffer system" refers to a component present in a composition or solution which may provide a resistance to significant change in pH caused by a strong acid or base. A buffer system may comprise a single agent or more than one agent, such as a weak acid and its conjugate base. A buffer system may provide a resistance to a significant pH change by interacting with a strong acid or strong base in a composition or solution, thereby at least partially preventing the pH of the composition or solution from changing significantly.

Generally, a buffer system has one or more buffer ranges wherein the buffer system has the ability to provide resistance to significant pH change. When a composition or solution comprising the buffer system has a pH inside the buffer system's buffer range, the pH of the composition or solution will not change significantly with the addition of equimolar amounts of a strong acid or strong base.

The buffer range of a buffer system is related to the acid dissociation constant (K_a) of one or more weak acids comprised by the buffer system. The term "acid dissociation constant" refers to the equilibrium constant of a dissociation reaction of an acid. The midpoint of a buffer range for a buffer system is generally about the logarithmic measure of the acid dissociation constant (i.e., the pK_a, equal to $-\log_{10} K_a$) of a weak acid comprised by the buffer system.

In some embodiments, the pH raising agent may comprise one or more pK_a values. In some embodiments, the pH raising agent may comprise a pK_a value that is within +/−1 unit of the initial pH of the pharmaceutical composition in the form of a solution without the pH raising agent. In some embodiments, the pH raising agent may have a pK_a value within the range of about 2 to 5, preferably within the range of about 3 to 4.5, more preferably within the range of about 3.5 to 4.5, and most preferably about 4.

In some embodiments, the pH raising agent may have a buffer range from a pH of about 2 to 5, preferably from a pH of about 3 to 4.5, and most preferably from a pH of about 3.5 to 4.5.

In some embodiments, the pH raising agent may provide a resistance to a significant change in pH that other components of the composition may otherwise cause in the absence of the pH raising agent. In some preferred embodiments, the pH raising agent may provide a resistance to the composition's pH being significantly lowered by degradants and/or reaction products of other components of the composition. For example, the pH raising agent may help resist an increase in acidity associated with the chemical reaction of an antioxidant.

In some embodiments, the pH raising agent may be present at a concentration in the range of about 0.1 and 4 mg/mL, preferably in the range of about 1 and 3 mg/mL, preferably in the range of about 1.5 and 2.5 mg/mL, and most preferably about 2.25 mg/mL. In some embodiments, the pH raising agent may be present at a concentration that provides a resistance to a significant change in the composition's pH despite physical and chemical changes of the composition after a certain period of shelf life.

In some embodiments, the pH raising agent is selected such that the degradation of other components of the composition is slowed or reduced, as compared to a composition in which the pH raising agent is not present. For example, the pH raising agent may at least in part help prevent significant degradation of an antioxidant after a certain period of shelf life.

In some embodiments, the pH raising agent is selected such that less antioxidant is present, as compared to a composition in which the pH raising agent is not present.

For example, the pH raising agent may be selected such that the concentration of antioxidant necessary for preventing and/or inhibiting the formation of unacceptable amounts of oxidative degradants in the composition after a certain period of shelf life is lowered by in the range of about 10% to 90%, preferably in the range of about 20% to 80%, more preferably in the range of about 25% and 75%, more preferably in the range of about 30% and 70%, and most preferably in the range of about 40% and 60%, as compared to a composition in which the pH raising agent is not present.

In some embodiments, the pH raising agent and pH raising agent concentration is such that compositions conform to the limit on total acidity imposed by the United States Pharmacopeia (USP) 37-NF 32, S2, monograph, effective from Dec. 1, 2014. For example, the pH raising agent may be selected

such that when 5.0 mL of the composition is titrated with 0.01 N NaOH, the total amount of titrant necessary to reach a pH of 7.4 is no more than 25 mL. The pH raising agent may be selected such that the composition has a titratable acid concentration of in the range of about 30 to 70 mM, preferably in the range of about 40 and 60 mM, and most preferably about 50 mM.

In some embodiments, the pH raising agent is suitable for subcutaneous, intracameral, intramuscular, parenteral, and/or ophthalmic use.

Preferably, pH raising agents comprise the acids or salt forms of one or more of lactate, tartarate, glutamate, malate, citrate, gluconate, benzoate, succinate, acetate, glycine, and aspartate, as well as lithium hydroxide, sodium hydroxide, potassium hydroxide, rubidium hydroxide, cesium hydroxide, calcium hydroxide, strontium hydroxide, and barium hydroxide. Preferably, the pH raising agent comprises at least one of tartaric acid and sodium hydroxide, and more preferably both of these compounds.

The present invention provides for a composition that may comprise at least one antioxidant. The term "antioxidant" refers to a component in a composition that may prevent and/or inhibit the formation of unacceptable amounts of oxidative degradants in the composition after a certain period of shelf life. In some embodiments, the antioxidant may react with oxygen that might otherwise compromise the composition by producing impurities in the composition. Oxygen may originate from the composition's environment or the composition itself. For example, oxygen may originate from residual oxygen present in the headspace of vials containing the composition.

In some embodiments, the oxidative degradants comprise one or more of adrenochrome, adrenolutin, and melanins.

In some embodiments, the antioxidant may limit the formation of oxidative degradants in the composition to less than about 1%, preferably less than about 0.1%, more preferably less than about 0.05%, more preferably less than about 0.04%, more preferably less than about 0.03%, more preferably less than about 0.02%, more preferably less than about 0.01%, most preferably less than about 0.009%, after a certain period of shelf life.

In some embodiments, the antioxidant may inhibit and/or prevent the composition from undergoing unacceptable physical changes. In some embodiments, the antioxidant may inhibit and/or prevent unacceptable composition color change. In some embodiments, the antioxidant may inhibit and/or prevent unacceptable amounts of insoluble particles.

In some embodiments, the antioxidant may inhibit and/or prevent the composition from undergoing unacceptable color changes that may be detected by visually examining a portion of a sample in a clear, glass test tube against a white background. In some embodiments, the antioxidant may inhibit and/or prevent the composition from undergoing unacceptable color changes that may be detected by comparing the absorbance of a sample of the composition in a 1-cm quartz cell using a spectrophotometer set at 460 nm with a 0.0004 N Iodine Standard Solution that is prepared with water and iodine. In some embodiments, the antioxidant may inhibit and/or prevent the composition from containing unacceptable amounts of particulate matter that may be detected by the methods described in USP <788> and/or USP <789>, the disclosures of which are included herein by reference.

In some embodiments, the antioxidant may be present at the lowest concentration that will inhibit and/or prevent the composition from undergoing unacceptable physical changes. In some embodiments, the antioxidant may be present at the lowest concentration that will inhibit and/or prevent unacceptable oxidation of components of the composition.

In some embodiments, the antioxidant may be present at a concentration of in the range of about 0.1 to 0.9 mg/mL, preferably in the range of about 0.2 and 0.8 mg/mL, more preferably in the range of about 0.3 and 0.7 mg/mL, more preferably in the range of about 0.4 and 0.6 mg/mL, and most preferably about 0.4 to 0.5 mg/mL.

In some embodiments, the concentration of antioxidant in the composition after a certain period of shelf life may be affected by other components of the composition that reduce and/or slow the rate of antioxidant degradation.

In some embodiments, other components of the composition may reduce and/or slow oxidation of the antioxidant after a certain period of shelf life. For example, when the antioxidant is sodium bisulfite, sodium metabisulfite, or another sulfite, other components of the composition may reduce and/or slow the oxidation of bisulfite to bisulfate.

In some embodiments, other components of the composition may reduce and/or slow protonation and/or desolvation reactions involving the antioxidant over a certain period of shelf life. For example, when the antioxidant is sodium bisulfite, sodium metabisulfite, or another sulfite, other components of the composition may reduce and/or slow the conversion to sulfur dioxide.

In some embodiments, other components of the composition may reduce and/or slow the degradation of antioxidant by raising the composition's initial pH and/or the pH of the composition after a certain period of shelf life, as compared to a composition in which the other components are not present. In some embodiments, the pH raising agent may, at least in part, lead to a reduction in the total degradation and/or degradation rate of antioxidant in the composition after a certain period of shelf life.

In some embodiments, other components are present in the composition at a concentration that reduces the concentration of antioxidant degradation products present in the composition after a certain period of shelf life. In some embodiments, other components are present in the composition at a concentration that increases the concentration of the antioxidant present in the composition after a certain period of shelf life, as compared to a composition in which the other components are not present. In some embodiments, the reduction and/or inhibition of unacceptable antioxidant degradation after a certain period of shelf life may reduce the initial concentration of antioxidant necessary to inhibit and/or prevent the composition from undergoing unacceptable physical changes after a certain period of shelf life. In some embodiments, less than about 90% of the initial amount of antioxidant is degraded after a certain period of shelf life, more preferably less than about 85%, more preferably less than about 80%, more preferably less than about 75%, more preferably less than about 70%, more preferably less than about 60%, more preferably less than about 50%, more preferably less than about 40%, more preferably less than about 30%, more preferably less than about 20%, and most preferably less than about 10%.

Preferably, pharmaceutically-acceptable antioxidants comprise one or more of an amino acid sulfite (e.g L-lysine sulfite), ascorbic acid, ascorbyl palmitate, benzotriazol, butylhydroxyanisole (BHA), butylhydroxytoluene (BHT), citric acid, cysteine, cysteine hydrochloride, disodium calcium ethylenediaminetetraacetate, disodium ethylenediaminetetraacetate, dithiothreitol, DL-alpha-tocopherol, erythorbic acid, ethoxyquin, ethylenediaminetetraacetic acid salts, fumaric acid, glutathione, guaiac, homocysteine, iso-

propyl citrate, L-ascorbate stearate esters, monothioglycerol, nordihydroguaiaretic acid (NDGA), palmitic acid ascorbic acid, pentaerythrityl-tetrakis[3-(3,5-di-t-butyl-4-hydroxyphenyl)propionate]2-mercaptobenzimidazole, potassium dichloroisocyanurate, propyl gallate, rongalite (CH2OHSO2Na), sodium ascorbate, sodium bisulfite, sodium edetate, sodium erythorbate, sodium hydrogen sulfite, sodium metabisulfite, sodium pyrosulfite 1,3-butylene glycol, sodium sulfite, sodium thioglycolate, sodium thiosulfate, soybean lecithin, tert-butyl hydroquinone, thioglycerol, thiourea, TPGS (tocopherol polyethylene glycol succinate), vitamin E and derivatives thereof, α-thioglycerin, and/or salts thereof. Preferably, the antioxidant comprises sodium bisulfite or sodium metabisulfite.

The present invention provides a composition that may include one or more transition metal complexing agents.

In some embodiments, the transition metal complexing agent may be a chelating agent. The term "chelating agent" refers to a substance capable of chelation, i.e, the formation or presence of two or more separate coordinate bonds between a polydentate ligand and a single central atom.

In some embodiments, the transition metal complexing agent may reduce the catalytic activity of trace metals present in the composition. In some embodiments, the transition metal complexing agent may chelate trace metals in the composition that may otherwise increase and/or accelerate the degradation of components in the composition. Examples of trace metals include, but are not limited to, iron, magnesium, lithium, zinc, copper, chromium, nickel, cobalt, vanadium, arsenic, molybdenum, manganese, selenium, and calcium.

In some embodiments, the transition metal complexing agent may chelate trace metals in the composition that may otherwise increase and/or accelerate degradant formation in the composition. In some embodiments, the transition metal complexing agent may inhibit the formation of degradants formed from the interaction of epinephrine, bisulfite, and oxygen. In some embodiments, these degradants comprise one or more of Impurity A, Impurity B, and Unknown C.

In some embodiments, the concentration of the transition metal complexing agent present in the composition may be such that the concentration of Impurity A, Impurity B, or Unknown C is about 1% or less of the composition after a certain period of shelf life, preferably about 0.9% or less, more preferably about 0.8% or less, more preferably about 0.7% or less, more preferably about 0.6% or less, more preferably about 0.5% or less, more preferably about 0.4% or less, more preferably about 0.3% or less, more preferably about 0.2% or less, and most preferably about 0.1% or less.

In some embodiments, the transition metal complexing agent may be present at the lowest concentration that reduces and/or inhibits degradation of other components of the composition. In some embodiments, the transition metal complexing agent may be present in the composition at a concentration of about 0.1 and 0.5 mg/mL, preferably in the range of about 0.1 and 0.4 mg/mL, more preferably in the range of about 0.1 and 0.3 mg/mL, and most preferably about 0.2 mg/mL.

Preferably, transition metal complexing agents comprise one or more of TPA (Tris[(2-pyridyl)methyl]amine), phanquinone (4,7-phenanthroline-5,6-dione), clioquinol (PN Gerolymatos SA), chloroquinol, penicillamine, trientine, N,N'-diethyldithiocarbamate (DDC), 2,3,2'-tetraamine(2,3,2'-tet), neocuproine, N,N,N',N'-tetrakis(2-pyridylmethyl) ethylenediamine (TPEN), 1,10-phenanthroline (PHE), tetraethylenepentamine (TEPA), triethylene tetraamine and tris(2-carboxyethyl)phosphine (TCEP), bathophenanthroline disulfonic acid (BPADA), Disodium Edetate Dihydrate (EDTA), ethylene glycol(bis)aminoethyl ether tetra acetic acid (EGTA), nitrilotriacetic acid, TIRON™, N,N-bis(2-hydroxyethyl)glycine (bicine), O,O'-bis(2-aminophenyl ethylene glycol)ethylenediamine-N,N,N',N'-tetraacetic acid (BAPTA), trans-1,2-diamino cyclohexane-ethylenediamine-N,N,N',N'-tetraacetic acid (CyDTA), 1,3-diamino-2-hydroxy-propane-ethylenediamine-N,N,N',N'-tetraacetic acid (DPTA-OH), ethylene-diamine-N,N'-dipropionic acid dihydrochloride (EDDP), ethylenediamine-N,N'-bis(methylene-phosphonic acid) hemihydrate (EDDPO), ethylenediamine-N,N,N',N'-tetrakis(methylenephosphonic acid) (EDTPO), N,N'-bis(2-hydroxybenzyl)ethylene diamine-N,N'-diacetic acid (HBED), 1,6-hexamethylenediamine-N,N,N',N'-tetraacetic acid (HDTA, or HEDTA), N-(2-hydroxyethyl)iminodiacetic acid (HIDA), iminodiacetic acid (IDA), 1,2-diaminopropane-N,N,N',N'-tetraacetic acid (methyl-EDTA), nitriltriacetic acid (NTA), nitrilotripropionic acid (NTP), nitrilotris (methylenephosphonic acid) trisodium salt (NTPO), triethylenetetramine-N,N,N',N'',N''-hexaacetic acid (TTHA), bathocuproine, bathophenanthroline, TETA, citric acid, salicylic acid, and/or malic acid, including analogues, derivatives, and pharmaceutically acceptable salts thereof. Preferably, the metal complexing agent comprises EDTA.

The present invention provides a composition that may include one or more pH lowering agent. The term "pH lowering agent" refers to a component of a composition selected to lower the composition's pH. In some embodiments, the pH lowering agent may be present in the composition such that the composition's pH is in a pharmaceutically acceptable range (i.e., not toxic or producing unacceptable side effects).

In some embodiments, the pH lowering agent may convert the active agent into a salt that is soluble in the composition. In some embodiments, the pH lowering agent may convert epinephrine into a hydrochloride salt.

In some embodiments, the pH lowering agent may be present at a concentration in the composition such that to the composition's pH is within the limit on total acidity imposed by the USP 37-NF 32, S2, monograph. In some embodiments, the pH lowering agent may be present in the composition at a concentration of in the range of about 0.1 to 1 mg/mL, preferably in the range of about 0.1 to 0.5 mg/mL, and most preferably about 0.25 mg/mL.

Preferably, the pH lowering agent comprises one or more of acetic acid, adipic acid, ascorbic acid, citric acid, hydrochloric acid, lactic acid, malic acid, monopotassium phosphate, monosodium phosphate, phosphoric acid, pyrophosphoric acid, succinic acid, sulfuric acid, and or tartaric acid. Preferably, the pH lowering agent comprises hydrochloric acid. In certain embodiments, the pH lowering agent may be a portion of the buffer system in conjugation with a pH raising agent.

The present invention provides for a composition that may comprise at least one tonicity regulating agent. The term "tonicity" refers to the effective osmotic pressure equivalent of a solution or composition. In some embodiments, the tonicity regulating agent may be present in the composition to maintain the tonicity of the composition in a physiological acceptable range. In some embodiments, the tonicity regulating agent may be an osmotic pressure regulating agent.

Preferably, the tonicity regulating agent comprises one or more of glucose, glycerin, hydroxypropyl methyl cellulose, mannitol, polysorbate, propylene glycol, sodium bromide, sodium chloride, sodium iodide, sorbitol, urea, xylitol, and/or combinations thereof. Preferably, the tonicity regulating agent comprises sodium chloride.

In some embodiments, the tonicity regulating agent may be present in the composition at a concentration of in the range of about 4 and 9 mg/mL, preferably in the range of about 5 and 8 mg/mL, and most preferably in the range of about 6 and 7.5 mg/mL. In some embodiments, the tonicity regulating agent may be present at a concentration of about 7.3 mg/mL. In some embodiments, the tonicity regulating agent may be present at a concentration of about 6.15 mg/mL.

The present invention provides for a composition that may optionally comprise one or more preservatives. The term "preservative" refers to a substance present in a composition which can, at least in part, prevent and/or reduce decomposition of the composition. In some embodiments, the preservative may prevent and/or reduce decomposition of the composition by microbial growth in the composition. Preferably, the preservative is pharmaceutically acceptable.

In some embodiments, the preservative may be present in the composition at a concentration that allows for a multi-dose formulation of the composition. In some embodiments, the preservative may be present in the composition at a concentration that prevents and/or reduces decomposition of unused portions of the composition in a multi-dose formulation. In some embodiments, the preservative may allow for up to about 14 days of use, preferably up to about 30 days of use, more preferably up to about 60 days of use, and most preferably up to about 90 days of use of a multi-dose formulation of the composition.

In some embodiments, the preservative may be present in the composition at a concentration of in the range of about 1 to 10 mg/mL, preferably in the range of about 3 and 7 mg/mL, more preferably in the range of about 4 and 6 mg/mL, more preferably in the range of about 4.5 and 5.5 mg/mL, and most preferably at about 5 mg/mL.

Preferably, preservatives comprise one or more of benzalkonium chloride, benzethonium chloride, benzoic acid, benzyl alcohol, benzyl paraben, bronopol, butyl paraben, cetrimide, cetylpyridinium chloride, chlorbutanol, chlorhexidine, chlorocresol, chloroxylenol, cresol, ethyl alcohol, ethyl paraben, ethylparaben, glycerin, hexetidine, imidurea, isobutyl paraben, meta-cresol, methyl paraben, methylparaben, phenol, phenoxyethanol, phenylethyl alcohol, phenylmercuric nitrate, p-hydroxybenzoic acid esters, polyhexamethylene biguanide ("PHMB"), potassium sorbate, propyl paraben, propylene glycol, sodium benzoate, sodium perborate, sodium propionate, sorbic acid, stabilized thimerosal, and/or thimerosal. Preferably, the preservative comprises chlorobutanol.

The present invention provides for a composition that can optionally comprise one or more solvents. In some embodiments, the solvent may be acceptable for pharmaceutical administration. Examples of methods of pharmaceutical administration include, but are not limited to, subcutaneous, intracameral, intravenous, and intramuscular injection, infusion, intra-arterial administration, intracardiac injection, endotracheal administration, intraosseous administration, oral inhalation, topical administration, and as ophthalmic irrigation.

Preferably, the solvent comprises one or more of acetic acid, acetone, acetonitrile, animal oil, aqueous buffer, benzene, bisabolol, butanol, carbon tetrachloride, chlorobenzene, chloroform, dimethylformamide, dioxane, essential oil, ethanol, ethyl acetate, ethyl oleate, ethylene chloride, fatty acid esters, glycerin, glycofurol, hexane, hydrogenated vegetable oil, isopropanol, isopropyl alcohol, isopropyl myristate, isopropyl palmitate, methanol, methylene chloride, mineral oil, polyethylene glycol, polyol, propylene glycol, silicone fluid glyceride, squalane, terpene, tetrahydrofuran, toluene, triacetin, tributyl citrate, triethyl citrate, vegetable oil, and/or water. Preferably the solvent comprises water.

In some embodiments, the solvent may be present in an amount that brings the composition to a final volume which is suitable for administration. In some embodiments, the final volume may be 1 mL. In some embodiments, the final volume may be 30 mL.

The present invention provides for a composition that may have a low level of impurities. The term "impurity" refers to an undesired substance in a composition. In some embodiments, an amount of impurities may be present in an initial composition and/or may be formed after a certain period of shelf life of a composition. In some embodiments, impurities may be formed via degradation of one or more components of the composition. Sources of degradation include, but are not limited to, oxidation, racemization, sulfite addition, visible light, ultraviolet light, moisture, heat, changes in pH, and composition component interactions. Unless indicated otherwise, the percentages of impurities expressed herein are expressed as % w/w of the active agent.

In some embodiments, the composition may have no more than about 20% of total impurities after a certain period of shelf life, more preferably no more than about 19.5%, more preferably no more than about 19%, more preferably no more than about 18.5%, preferably no more than about 18%, more preferably no more than about 17.5%, more preferably no more than about 17%, more preferably no more than about 16.5%, more preferably no more than about 16%, more preferably no more than about 15.5%, more preferably no more than about 15%, more preferably no more than about 14.5%, more preferably no more than about 14%, more preferably no more than about 13.5%, more preferably no more than about 13%, more preferably no more than about 12.5%, more preferably no more than about 12%, more preferably no more than about 11.5%, more preferably no more than about 11%, more preferably no more than about 10.5%, more preferably no more than about 10%, more preferably no more than about 9.5%, more preferably no more than about 9%, more preferably no more than about 8.5%, more preferably no more than about 8%, more preferably no more than about 7.5%, more preferably no more than about 7%, more preferably no more than about 6.5%, more preferably no more than about 6%, more preferably no more than about 5.5%, and most preferably no more than about 5%.

In some embodiments, the composition may have no more than about 20% of total impurities after a certain period of shelf life, preferably no more than about 19.9%, more preferably no more than about 19.8%, more preferably no more than about 19.7%, more preferably no more than about 19.6%, more preferably no more than about 19.5%, more preferably no more than about 19.4%, more preferably no more than about 19.3%, more preferably no more than about 19.2%, more preferably no more than about 19.1%, more preferably no more than about 19%, more preferably no more than about 18.9%, more preferably no more than about 18.8%, more preferably no more than about 18.7%, more preferably no more than about 18.6%, more preferably no more than about 18.5%, more preferably no more than about 18.4%, more preferably no more than about 18.3%, more preferably no more than about 18.2%, more preferably no more than about 18.1%, more preferably no more than about 18%, more preferably no more than about 17.9%, more preferably no more than about 17.8%, more preferably no more than about 17.7%, more preferably no more than about 17.6%, more preferably no more than about 17.5%, more preferably no more than about 17.4%, more preferably no

more than about 17.3%, more preferably no more than about 17.2%, more preferably no more than about 17.1%, more preferably no more than about 17%, more preferably no more than about 16.9%, more preferably no more than about 16.8%, more preferably no more than about 16.7%, more preferably no more than about 16.6%, more preferably no more than about 16.5%, more preferably no more than about 16.4%, more preferably no more than about 16.3%, more preferably no more than about 16.2%, more preferably no more than about 16.1%, more preferably no more than about 16%, more preferably no more than about 15.9%, more preferably no more than about 15.8%, more preferably no more than about 15.7%, more preferably no more than about 15.6%, more preferably no more than about 15.5%, more preferably no more than about 15.4%, more preferably no more than about 15.3%, more preferably no more than about 15.2%, more preferably no more than about 15.1%, more preferably no more than about 15%, more preferably no more than about 14.9%, more preferably no more than about 14.8%, more preferably no more than about 14.7%, more preferably no more than about 14.6%, more preferably no more than about 14.5%, more preferably no more than about 14.4%, more preferably no more than about 14.3%, more preferably no more than about 14.2%, more preferably no more than about 14.1%, more preferably no more than about 14%, more preferably no more than about 13.9%, more preferably no more than about 13.8%, more preferably no more than about 13.7%, more preferably no more than about 13.6%, more preferably no more than about 13.5%, more preferably no more than about 13.4%, more preferably no more than about 13.3%, more preferably no more than about 13.2%, more preferably no more than about 13.1%, more preferably no more than about 13%, more preferably no more than about 12.9%, more preferably no more than about 12.8%, more preferably no more than about 12.7%, more preferably no more than about 12.6%, more preferably no more than about 12.5%, more preferably no more than about 12.4%, more preferably no more than about 12.3%, more preferably no more than about 12.2%, more preferably no more than about 12.1%, more preferably no more than about 12%, more preferably no more than about 11.9%, more preferably no more than about 11.8%, more preferably no more than about 11.7%, more preferably no more than about 11.6%, more preferably no more than about 11.5%, more preferably no more than about 11.4%, more preferably no more than about 11.3%, more preferably no more than about 11.2%, more preferably no more than about 11.1%, more preferably no more than about 11%, more preferably no more than about 10.9%, more preferably no more than about 10.8%, more preferably no more than about 10.7%, more preferably no more than about 10.6%, more preferably no more than about 10.5%, more preferably no more than about 10.4%, more preferably no more than about 10.3%, more preferably no more than about 10.2%, more preferably no more than about 10.1%, more preferably no more than about 10%, more preferably no more than about 9.9%, more preferably no more than about 9.8%, more preferably no more than about 9.7%, more preferably no more than about 9.6%, more preferably no more than about 9.5%, more preferably no more than about 9.4%, more preferably no more than about 9.3%, more preferably no more than about 9.2%, more preferably no more than about 9.1%, more preferably no more than about 9%, more preferably no more than about 8.9%, more preferably no more than about 8.8%, more preferably no more than about 8.7%, more preferably no more than about 8.6%, more preferably no more than about 8.5%, more preferably no more than about 8.4%, more preferably no more than about 8.3%, more preferably no more than about 8.2%, more preferably no more than about 8.1%, more preferably no more than about 8%, more preferably no more than about 7.9%, more preferably no more than about 7.8%, more preferably no more than about 7.7%, more preferably no more than about 7.6%, more preferably no more than about 7.5%, more preferably no more than about 7.4%, more preferably no more than about 7.3%, more preferably no more than about 7.2%, more preferably no more than about 7.1%, more preferably no more than about 7%, more preferably no more than about 6.9%, more preferably no more than about 6.8%, more preferably no more than about 6.7%, more preferably no more than about 6.6%, more preferably no more than about 6.5%, more preferably no more than about 6.4%, more preferably no more than about 6.3%, more preferably no more than about 6.2%, more preferably no more than about 6.1%, more preferably no more than about 6%, more preferably no more than about 5.9%, more preferably no more than about 5.8%, more preferably no more than about 5.7%, more preferably no more than about 5.6%, more preferably no more than about 5.5%, more preferably no more than about 5.4%, more preferably no more than about 5.3%, more preferably no more than about 5.2%, more preferably no more than about 5.1%, and most preferably no more than about 5%.

In some embodiments, the concentration of impurities present in the composition after a certain period of shelf life may be attributed at least partially to degradation of components of the composition. In some embodiments, the concentration of impurities present in the composition at the end of shelf life may be attributed at least partially to epinephrine degradation. In some embodiments, epinephrine degradation may be a result of physical or chemical stress. Examples of stresses include, but are not limited to, oxygen, pH, bisulfite, light, process surface compatibility, and soluble trace metals.

In some embodiments, components of the composition may be present at a concentration that lowers the amount of impurities after a certain period of shelf life that would otherwise be present in the absence of the components. In some embodiments, components of the composition may be present at a concentration that at least partially inhibits formation of impurities in the composition.

The present invention provides for a composition that may have a low level of D-epinephrine.

In some embodiments, the concentration of D-epinephrine in the composition after a certain period of shelf life may be no more than about 9.5%, preferably no more than about 9%, more preferably no more than about 8.5%, more preferably no more than about 8%, more preferably no more than about 7.5%, more preferably no more than about 7%, more preferably no more than about 6.5%, more preferably no more than about 6%, more preferably no more than about 5.5%, more preferably no more than about 5%, more preferably no more than about 4.5%, more preferably no more than about 4%, more preferably no more than about 3.5%, more preferably no more than about 3%, more preferably no more than about 2.5%, more preferably no more than about 2%, more preferably no more than about 1.5%, more preferably no more than about 1%, and most preferably no more than about 0.5%.

In some embodiments, the concentration of D-epinephrine in the composition after a period of shelf life may be no more than about 9.5%, preferably no more than about 9.4%, more preferably no more than about 9.3%, more preferably no more than about 9.2%, more preferably no more than about 9.1%, more preferably no more than about 9%, more preferably no more than about 8.9%, more preferably no more than about 8.8%, more preferably no more than about 8.7%, more preferably no more than about 8.6%, more preferably no

more than about 8.5%, more preferably no more than about 8.4%, more preferably no more than about 8.3%, more preferably no more than about 8.2%, more preferably no more than about 8.1%, more preferably no more than about 8%, more preferably no more than about 7.9%, more preferably no more than about 7.8%, more preferably no more than about 7.7%, more preferably no more than about 7.6%, more preferably no more than about 7.5%, more preferably no more than about 7.4%, more preferably no more than about 7.3%, more preferably no more than about 7.2%, more preferably no more than about 7.1%, more preferably no more than about 7%, more preferably no more than about 6.9%, more preferably no more than about 6.8%, more preferably no more than about 6.7%, more preferably no more than about 6.6%, more preferably no more than about 6.5%, more preferably no more than about 6.4%, more preferably no more than about 6.3%, more preferably no more than about 6.2%, more preferably no more than about 6.1%, more preferably no more than about 6%, more preferably no more than about 5.9%, more preferably no more than about 5.8%, more preferably no more than about 5.7%, more preferably no more than about 5.6%, more preferably no more than about 5.5%, more preferably no more than about 5.4%, more preferably no more than about 5.3%, more preferably no more than about 5.2%, more preferably no more than about 5.1%, more preferably no more than about 5%, more preferably no more than about 4.9%, more preferably no more than about 4.8%, more preferably no more than about 4.7%, more preferably no more than about 4.6%, more preferably no more than about 4.5%, more preferably no more than about 4.4%, more preferably no more than about 4.3%, more preferably no more than about 4.2%, more preferably no more than about 4.1%, more preferably no more than about 4%, more preferably no more than about 3.9%, more preferably no more than about 3.8%, more preferably no more than about 3.7%, more preferably no more than about 3.6%, more preferably no more than about 3.5%, more preferably no more than about 3.4%, more preferably no more than about 3.3%, more preferably no more than about 3.2%, more preferably no more than about 3.1%, more preferably no more than about 3%, more preferably no more than about 2.9%, more preferably no more than about 2.8%, more preferably no more than about 2.7%, more preferably no more than about 2.6%, more preferably no more than about 2.5%, more preferably no more than about 2.4%, more preferably no more than about 2.3%, more preferably no more than about 2.2%, more preferably no more than about 2.1%, more preferably no more than about 2%, more preferably no more than about 1.9%, more preferably no more than about 1.8%, more preferably no more than about 1.7%, more preferably no more than about 1.6%, more preferably no more than about 1.5%, more preferably no more than about 1.4%, more preferably no more than about 1.3%, more preferably no more than about 1.2%, more preferably no more than about 1.1%, more preferably no more than about 1%, more preferably no more than about 0.9%, more preferably no more than about 0.8%, more preferably no more than about 0.7%, more preferably no more than about 0.6%, and most preferably no more than about 0.5%.

In some embodiments, the initial concentration of D-epinephrine in the composition may be no more than about 2.5%, preferably no more than about 2%, more preferably no more than about 1.5%, more preferably no more than about 1%, and most preferably no more than about 0.5%.

In some embodiments, components of the composition may be present at concentrations that reduce the formation of D-epinephrine that would otherwise occur in the absence of the components. In some embodiments, components of the composition may be present at concentrations that reduce D-epinephrine formation by at least about 15%, more preferably at least about 33%, and most preferably at least about 50%.

In some embodiments, components of the composition may be present at a concentration that reduces the rate and/or extent of D-epinephrine formation after a certain period of shelf life. In some embodiments, components of the composition may reduce D-epinephrine formation by raising the initial pH of the composition and/or by increasing the pH range of the composition over shelf life. In some embodiments, the pH of the composition may be raised at least partially by the pH raising agent. Preferably, the raised pH of the composition does not result in large increases of other degradants of epinephrine.

The present invention provides for a composition that may have a low level of epinephrine sulfonic acid (ESA). In some embodiments, the concentration of ESA in the composition after a certain period of shelf life may be no more than about 14.5%, preferably no more than about 14%, more preferably no more than about 13.5%, more preferably no more than about 13%, more preferably no more than about 12.5%, more preferably no more than about 12%, more preferably no more than about 11.5%, more preferably no more than about 11%, more preferably no more than about 10.5%, more preferably no more than about 10%, more preferably no more than about 9.5%, more preferably no more than about 9%, more preferably no more than about 8.5%, more preferably no more than about 8%, more preferably no more than about 7.5%, more preferably no more than about 7%, more preferably no more than about 6.5%, more preferably no more than about 6%, and most preferably no more than about 5.5%.

In some embodiments, the concentration of ESA in the composition after a certain period of shelf life may be no more than about 14.5%, preferably no more than about 14.4%, more preferably no more than about 14.3%, more preferably no more than about 14.2%, more preferably no more than about 14.1%, more preferably no more than about 14%, more preferably no more than about 13.9%, more preferably no more than about 13.8%, more preferably no more than about 13.7%, more preferably no more than about 13.6%, more preferably no more than about 13.5%, more preferably no more than about 13.4%, more preferably no more than about 13.3%, more preferably no more than about 13.2%, more preferably no more than about 13.1%, more preferably no more than about 13%, more preferably no more than about 12.9%, more preferably no more than about 12.8%, more preferably no more than about 12.7%, more preferably no more than about 12.6%, more preferably no more than about 12.5%, more preferably no more than about 12.4%, more preferably no more than about 12.3%, more preferably no more than about 12.2%, more preferably no more than about 12.1%, more preferably no more than about 12%, more preferably no more than about 11.9%, more preferably no more than about 11.8%, more preferably no more than about 11.7%, more preferably no more than about 11.6%, more preferably no more than about 11.5%, more preferably no more than about 11.4%, more preferably no more than about 11.3%, more preferably no more than about 11.2%, more preferably no more than about 11.1%, more preferably no more than about 11%, more preferably no more than about 10.9%, more preferably no more than about 10.8%, more preferably no more than about 10.7%, more preferably no more than about 10.6%, more preferably no more than about 10.5%, more preferably no more than about 10.4%, more preferably no more than about 10.3%, more preferably no more than about 10.2%, more preferably no more than about

10.1%, more preferably no more than about 10%, more preferably no more than about 9.9%, more preferably no more than about 9.8%, more preferably no more than about 9.7%, more preferably no more than about 9.6%, more preferably no more than about 9.5%, more preferably no more than about 9.4%, more preferably no more than about 9.3%, more preferably no more than about 9.2%, more preferably no more than about 9.1%, more preferably no more than about 9%, more preferably no more than about 8.9%, more preferably no more than about 8.8%, more preferably no more than about 8.7%, more preferably no more than about 8.6%, more preferably no more than about 8.5%, more preferably no more than about 8.4%, more preferably no more than about 8.3%, more preferably no more than about 8.2%, more preferably no more than about 8.1%, more preferably no more than about 8%, more preferably no more than about 7.9%, more preferably no more than about 7.8%, more preferably no more than about 7.7%, more preferably no more than about 7.6%, more preferably no more than about 7.5%, more preferably no more than about 7.4%, more preferably no more than about 7.3%, more preferably no more than about 7.2%, more preferably no more than about 7.1%, more preferably no more than about 7%, more preferably no more than about 6.9%, more preferably no more than about 6.8%, more preferably no more than about 6.7%, more preferably no more than about 6.6%, more preferably no more than about 6.5%, more preferably no more than about 6.4%, more preferably no more than about 6.3%, more preferably no more than about 6.2%, more preferably no more than about 6.1%, more preferably no more than about 6%, more preferably no more than about 5.9%, more preferably no more than about 5.8%, more preferably no more than about 5.7%, more preferably no more than about 5.6%, and most preferably no more than about 5.5%.

In some embodiments, the initial concentration of ESA in the composition may be no more than about 0.5%, preferably no more than about 0.2%, more preferably no more than about 0.1%, more preferably no more than about 0.05%, and most preferably no more than about 0.025%.

In some embodiments, ESA formation may be influenced by an oxygen-dependent mechanism such that reducing oxygen accessible to the composition may reduce the rate of ESA formation. In some embodiments, oxygen present in the headspace of a vial containing the composition may be reduced by replacing some or all of the oxygen with a gas other than oxygen, preferably an inert gas, thereby at least partially reducing the rate of ESA production. In some embodiments, some or all of the oxygen present in the headspace of a vial containing the composition may be replaced with nitrogen and/or argon.

In some embodiments, the headspace gas of the composition is manipulated such that degradation of components in the composition is minimized. The term "headspace" refers to the gas space above the product in a container. The headspace gas may be manipulated in order to reduce the amount of oxygen present therein. In some embodiments, the amount of oxygen in the headspace gas is no more than about 15% v/v of the total gas, preferably no more than about 13%, more preferably no more than about 10%, more preferably no more than about 5%, more preferably no more than about 2.5%, more preferably no more than about 1%, and most preferably about 0%.

In some embodiments of the present invention, the concentrations of certain components of the composition may be reduced such that the concentration of ESA in the composition after a period of shelf life is reduced. In some embodiments, the concentration of ESA present in the composition after a period of shelf life is reduced at least partially by reducing the initial concentration of antioxidant in the composition. In some embodiments, the concentrations of certain components of the composition, such as initial concentration of antioxidant, are reduced such that the rate of ESA production is reduced by at least about 25%, more preferably at least about 50%, and most preferably at least about 75% after a certain period of shelf life, as compared to a composition in which the certain components are not present.

The present invention provides for a composition that may have a low level of oxidative degradants. The term "oxidative degradant" refers to any impurity that may be at least partially attributed to an oxidation reaction involving one or more components of the composition. In some embodiments, the oxidative degradants may be formed via oxidation of epinephrine. Examples of oxidative degradants include, but are not limited to, adrenochrome, adrenolutin, melanins, and analogs thereof.

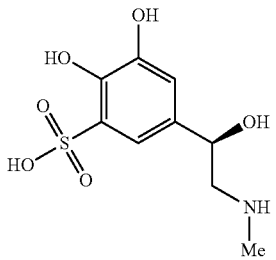
In some embodiments, the concentration of oxidative degradants in the composition after a certain period of shelf life may be no more than about 1%, preferably no more than about 0.1%, more preferably no more than about 0.05%, more preferably no more than about 0.04%, more preferably no more than about 0.03%, more preferably no more than about 0.02%, and most preferably no more than about 0.01%, after a certain period of shelf life.

In some embodiments, the concentration of oxidative degradants present in the composition after a certain period of shelf life may be such that the composition does not undergo a physical change. Examples of physical change include, but are not limited to, color change and insoluble particle formation.

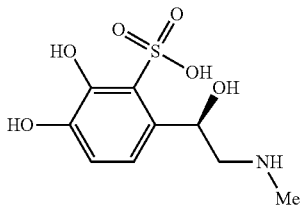
In some embodiments, the rate of formation and/or the concentration of oxidative degradants in the composition may be reduced after a certain period of shelf life by other components of the composition. In some embodiments, the rate of formation and/or the concentration of oxidative degradants in the composition may be reduced by the antioxidant. In some embodiments, the rate of formation and/or the concentration of oxidative degradants in the composition may be reduced by reducing the amount of oxygen accessible to the composition. In some embodiments, the rate of formation and/or the concentration of oxidative degradants in the composition may be reduced by replacing some or all of the oxygen in the headspace of a vial containing the composition with non-oxygen gas, preferably an inert gas such as nitrogen and/or argon.

In some embodiments, the present invention may have low levels of degradants Impurity A, Impurity B, and/or Unknown C.

In some embodiments, Impurity A may be a compound with the following structure:



In some embodiments, Impurity B may be a compound with the following structure:



In some embodiments, Unknown C may be characterized by a λ_{max} of about 380 nm.

In some embodiments, Unknown C may be characterized by its elution peak using HILIC (Hydrophilic Interaction Liquid Chromatography), which differs from one substance to another.

In some embodiments, Unknown C may be characterized using an isocratic HILIC separation of mixtures according to the conditions described in Tables 1-3.

Table 1 lists the compositions of the mobile phases that may be used for isocratic HILIC separations.

TABLE 1

Composition of Isocratic Mobile Phases

Mobile Phase A	100 mL Ammonium Formate Buffer 900 mL Acetonitrile
Mobile Phase B	100 mL Ammonium Formate Buffer 400 mL Water 500 mL Acetonitrile

The Ammonium Formate Buffer of Table 1 may be prepared as follows: 1.5 g of Sodium Chloride, 5.0 mL of Formic Acid, and 3.0 mL of 6N Ammonium Hydroxide is added to 1.0 L of water. The solution may be vacuum filtered through a 0.45 μm nylon membrane. The preparation may be scaled up where necessary.

Table 2 lists different conditions that may be used for isocratic HILIC separations.

TABLE 2

Isocratic Mobile Phases for HILIC Separation

Isocratic Water %	Mobile Phase A %	Mobile Phase B %
15	87.5	12.5
18	80	20
22	70	30

An Epinephrine HILIC Impurities Marker Solution (Epi-HILIC IMS) may be prepared by first preparing an Epinephrine/Degradant Bulk Solution as follows: In a clean, clear, 2 L glass bottle, dissolving sodium chloride (6.147 g) and tartaric acid (2.251 g) in about 800 mL of water, adding sodium hydroxide 5.0N (6.25 mL) to the solution and mixing, adding sodium metabisulfite (1.425 g) to the solution and mixing to dissolve, adding epinephrine (1.1334 g) as a solution in HCl 1.0N (6.6 mL) to the solution, and then adding water to a final solution weight of 1005.9, and mixing thoroughly. The Epinephrine/Degradant Bulk Solution may then be allowed to sit in a capped bottle in the hood, under fluorescent light with a light exposure at about 1000 lux, for 12 days with lights continuously on.

The Epinephrine HILIC Impurities Marker Solution (Epi-HILIC IMS) may then be prepared in a 500 mL clear glass bottle as follows: adding Epinephrine/Degradant Bulk Solution (500 mL), adding HCl 1.0 N (6.0 mL) and then mixing (with a final pH at 3.2), adding ESA (9.5 mg) and mixing to dissolve, adding adrenochrome (5.6 mg) and mixing to dissolve, preparing adrenalone stock mixture by withdrawing 10 mL of the solution then adding and dissolving adrenalone HCl (4.7 mg), adding adrenalone stock mixture (0.8 mL) back into the bulk mixture, and mixing thoroughly.

An Epinephrine HILIC Impurities Marker Solution (Epi-HILIC IMS) which comprises Unknown C may be analyzed using the conditions listed in Table 3.

TABLE 3

Chromatographic Conditions for Isocratic HILIC Separation

Column	SeQuant ZIC HILIC PEEK, 150 X 4.6 mm, 3.5 μm particle size, 100 Å pore size
Flow Rate	1 mL/min
Injection Volume	25 μL
Column Temperature	35° C.
Sample preparation	Dilute exactly 1 volume of sample (nominal strength of 1 mg/mL epinephrine) with exactly 3 volumes of acetonitrile.
Detector	Signal-280 nm, Bandwidth- 10 nm; Reference-Off Signal-346 nm, Bandwidth- 10 nm; Reference-Off Signal-380 nm, Bandwidth- 10 nm; Reference-Off Signal-292 nm, Bandwidth-10 nm; Reference-Off
Run Time	35 minutes
Data Acquisition	Integrate impurities between 0 and 30 minutes

Tables 4 lists the relevant characteristic peaks of isocratic HILIC separation according to the above specifications at a detection wavelength of 346 nm using the 15% isocratic water preparation according to Table 2.

TABLE 4

Chromatography of the Impurities Marker Solution using isocratic HILIC with 15% water and 346 nM Detection

	Time (Minutes)	Absorbance (AU)
Unknown C	approx. 21	approx. 0.001

Tables 5 lists the relevant characteristic peaks of isocratic HILIC separation according to the above specifications at a detection wavelength of 346 nm using the 18% isocratic water preparation according to Table 2.

TABLE 5

Chromatography of the Impurities Marker Solution using isocratic HILIC with 18% water and 346 nM Detection

	Time (Minutes)	Absorbance (AU)
Unknown C	approx. 14	approx. 0.002

Table 6 lists the relevant characteristic peaks of isocratic HILIC separation according to the above specifications at a detection wavelength of 346 nm using the 22% isocratic water preparation according to Table 2.

TABLE 6

Chromatography of the Impurities Marker Solution using isocratic HILIC with 22% water and 346 nM Detection		
	Time (Minutes)	Absorbance (AU)
Unknown C	approx. 8.5	approx. 0.002

The chromatography outputs of the Impurities Marker Solution using isocratic HILIC as described is also shown in FIG. **1** (15% water), FIG. **2** (18% water), and FIG. **3** (22% water).

In some embodiments, Unknown C may be characterized using a gradient HILIC method. An Epinephrine HILIC Impurities Marker Solution (EpiHILIC IMS) which comprises Unknown C may be analyzed using the conditions listed in Table 7 and 8.

Table 7 lists the compositions of the mobile phases that may be used for gradient HILIC separations.

TABLE 7

Composition of Gradient Mobile Phases	
Mobile Phase A	100 mL Ammonium Formate Buffer 900 mL Acetonitrile
Mobile Phase A	100 mL Ammonium Formate Buffer 400 mL Water 500 mL Acetonitrile

Table 8 lists the solvent program for the gradient HILIC method.

TABLE 8

Solvent program for the gradient HILIC method.

Time	Flow	Mobile Phase Composition		
(min)	(mL/min)	Water %	A%	B%
Initial	1.0	15.2	87	13
12	1.0	15.2	87	13
22	1.0	22	70	30
25	1.0	22	70	30
28	1.0	15.2	87	13
35	1.0	15.2	87	13

The chromatographic conditions for the gradient HILIC are the same as those listed in Table 3.

The chromatography outputs of the Impurities Marker Solution using gradient HILIC according to the above specifications at detection wavelengths of 280 nm, 292 nm, 346 nm, and 380 nm are shown in FIG. **4**.

In some embodiments, the concentration Impurity A, Impurity B, and Unknown C together in the composition after a certain period of shelf life is no more than about 5%, preferably no more than about 4%, more preferably no more than about 3%, more preferably no more than about 2%, more preferably no more than about 1%, and most preferably no more than about 0.5%.

In some embodiments, the concentration of Impurity A in the composition after a certain period of shelf life may be no more than about 2%, preferably no more than about 1.9%, more preferably no more than about 1.8%, more preferably no more than about 1.7%, more preferably no more than about 1.6%, more preferably no more than about 1.5%, more preferably no more than about 1.4%, more preferably no more than about 1.3%, more preferably no more than about 1.2%, more preferably no more than about 1.1%, more preferably no more than about 1%, more preferably no more than about 0.9%, more preferably no more than about 0.8%, more preferably no more than about 0.7%, more preferably no more than about 0.6%, more preferably no more than about 0.5%, more preferably no more than about 0.4%, more preferably no more than about 0.3%, more preferably no more than about 0.2%, and most preferably no more than about 0.1%.

In some embodiments, the concentration of Impurity B in the composition after a certain period of shelf life may be no more than about 2%, preferably no more than about 1.9%, more preferably no more than about 1.8%, more preferably no more than about 1.7%, more preferably no more than about 1.6%, more preferably no more than about 1.5%, more preferably no more than about 1.4%, more preferably no more than about 1.3%, more preferably no more than about 1.2%, more preferably no more than about 1.1%, more preferably no more than about 1%, more preferably no more than about 0.9%, more preferably no more than about 0.8%, more preferably no more than about 0.7%, more preferably no more than about 0.6%, more preferably no more than about 0.5%, more preferably no more than about 0.4%, more preferably no more than about 0.3%, more preferably no more than about 0.2%, and most preferably no more than about 0.1%.

In some embodiments, the concentration of Unknown C in the composition after a certain period of shelf life may be no more than about 2%, preferably no more than about 1.9%, more preferably no more than about 1.8%, more preferably no more than about 1.7%, more preferably no more than about 1.6%, more preferably no more than about 1.5%, more preferably no more than about 1.4%, more preferably no more than about 1.3%, more preferably no more than about 1.2%, more preferably no more than about 1.1%, more preferably no more than about 1%, more preferably no more than about 0.9%, more preferably no more than about 0.8%, more preferably no more than about 0.7%, more preferably no more than about 0.6%, more preferably no more than about 0.5%, more preferably no more than about 0.4%, more preferably no more than about 0.3%, more preferably no more than about 0.2%, and most preferably no more than about 0.1%.

In some embodiments, the presence of Impurity A, Impurity B, and/or Unknown C in the composition may be at least partially related to the presence of oxygen such that reducing oxygen accessible to the composition may reduce the amount of Impurity A, Impurity B, and/or Unknown C present in the composition. In some embodiments, oxygen present in the headspace of a vial containing the composition may be reduced by replacing some or all of the oxygen a gas other than oxygen, preferably an inert gas, thereby at least partially reducing the amount of Impurity A, Impurity B, and/or Unknown C present in the composition. In some embodiments, some or all of the oxygen present in the headspace of a vial containing the composition may be replaced with nitrogen and/or argon.

In some embodiments, other components of the composition may be present at a concentration that reduces the amount of Impurity A, Impurity B, and/or Unknown C present in the composition after a certain period of shelf life and/or reduces the rate of Impurity A, Impurity B, and/or Unknown C formation. In some embodiments, other components of the composition may reduce the amount of Impurity A, Impurity B, and/or Unknown C present in the composition after a certain period of shelf life by interfering with an interaction involving other components of the composition. In some embodiments, other components of the composition may reduce the amount of Impurity A, Impurity B, and/or Unknown C present in the composition after a certain period of shelf life

by interfering with an oxidative processes involving epinephrine. In some embodiments, other components of the composition may reduce the presence of Impurity A, Impurity B, and/or Unknown C in the composition after a certain period of shelf life by interacting with a trace metal present in the composition. In some embodiments, the transition metal complexing agent may reduce the amount of Impurity A, Impurity B, and/or Unknown C present in the composition after a certain period of shelf life.

The present invention provides for compositions that may have an extended shelf life. As used throughout this application, the term "shelf life" refers to the length of time that a product may be stored without becoming unfit for medical use. Examples of compositions which are unfit for medical use include, but are not limited to, compositions with unacceptably high impurity levels and/or the presence of physical changes described herein, such as color change and/or the presence of insoluble particles.

In some embodiments, the period of shelf life of the composition may be 1 month, preferably 2 months, more preferably 3 months, more preferably 4 months, more preferably 5 months, more preferably 6 months, more preferably 7 months, more preferably 8 months, more preferably 9 months, more preferably 10 months, more preferably 11 months, more 12 months, preferably 13 months, more preferably 14 months, more preferably 15 months, more preferably 16 months, more preferably 17 months, more preferably 18 months, more preferably 19 months, more preferably 20 months, more preferably 21 months, more preferably 22 months, more preferably 23 months, more preferably 24 months, more preferably 25 months, more preferably 26 months, more preferably 27 months, more preferably 28 months, more preferably 29 months, more preferably 30 months, more preferably 31 months, more preferably 32 months, more preferably 33 months, more preferably 34 months, more preferably 35 months, and most preferably 36 months. In some embodiments, the period of shelf life may vary based on product presentation.

In some embodiments, shelf life may be determined by measuring certain characteristics of the composition that may indicate that the composition is unfit for medical use. In some embodiments, shelf life may be determined by measuring the concentration of impurities in the composition after storage at 25° C. and 60% relative humidity. In some embodiments, shelf life may be determined by measuring the concentration of impurities in the composition after storage at 37° C. and 65% relative humidity.

In some embodiments, shelf life may be determined by measuring the concentration of impurities in the composition using the guidelines as outlined in the *ICH Harmonised Tripartite Guideline: Stability Testing of New Drug Substances and Products Q1A(R2)*, dated Feb. 6, 2003, the disclosure of which is incorporated by reference herein in its entirety.

For example, shelf life may be determined for long term, accelerated, and, where appropriate, intermediate storage conditions by measuring the concentration of impurities after storage in the following conditions, wherein the composition is packaged in a container closure system that is the same as or simulates the packaging proposed for storage and distribution.

Study	Storage condition	Minimum time period covered
Long term	25° C. ± 2° C./60% RH ± 5% RH	12 months
	or 30° C. ± 2° C./65% RH ± 5% RH	
Intermediate	30° C. ± 2° C./ 65% RH ± 5% RH	6 months
Accelerated	40° C. ± 2° C./75% RH ± 5% RH	6 months

In some embodiments, shelf life may be attributed at least in part to the concentration of impurities in the composition such that the reduction of impurity concentration and/or rate of impurity formation lengthens the composition's shelf life.

The present invention provides for compositions that may have an initial pH which at least partially influences any of the mechanisms described herein. In some embodiments, the initial pH of the composition may be such that the rate of component degradation is minimized. For example, the initial pH of the composition may be such that the rate of formation of D-epinephrine is minimized after a certain period of shelf life. In some embodiments, the initial pH range of the composition may be in the range of about 3.5 and 4.5, preferably in the range of about 3.6 and 4.4, more preferably in the range of about 3.7 and 4.3, more preferably in the range of about 3.8 and 4.2, more preferably in the range of about 3.9 and 4.1, and most preferably about 4.0.

In some embodiments, components of the composition may be selected such that the pH of the composition is within a preferred range. For example, in some embodiments, the pH raising agent may be present in the composition such that the pH of the composition is higher than what it would otherwise be without the presence of the pH raising agent.

In some embodiments, the initial pH may be such that the composition conforms to industry requirements, such as the limit on total acidity imposed by the USP 37-NF 32, S2, monograph.

The present invention also provides for compositions that may resist significant pH change after a certain period of shelf life. In some embodiments, the pH range after a certain period of shelf life of the composition may be in the range of about 2.5 and 5, preferably in the range of about 2.6 and 4.9, more preferably in the range of about 2.7 and 4.8, more preferably in the range of about 2.8 and 4.7, more preferably in the range of about 2.9 and 4.6, more preferably in the range of about 3.0 and 4.5, more preferably in the range of about 3.1 and 4.4, more preferably in the range of about 3.2 and 4.3, more preferably in the range of about 3.3 and 4.2, more preferably in the range of about 3.4 and 4.1, and most preferably in the range of about 3.5 and 4.0.

In some embodiments, components of the composition may be selected such that the pH range after a certain period of shelf life of the composition is within a preferred range. For example, in some embodiments, the pH raising agent may be present in the composition such that the pH range after a certain period of shelf life of the composition is higher than what it would otherwise be without the presence of the pH raising agent.

In some embodiments, the pH range after a certain period of shelf life of the composition may be such that the degradation of components of the composition is reduced. In some embodiments, the pH range after a certain period of shelf life of the composition may be such that the formation of D-epinephrine is reduced. In some embodiments, the pH range after a certain period of shelf life of the composition may be

such that the amount of D-epinephrine present in the composition is in a preferred range described herein.

In some embodiments, the pH range after a certain period of shelf life may be such that the degradation of the antioxidant is reduced. For example, the conversion of bisulfite to sulfur dioxide may be reduced. The reduction of the conversion of bisulfite to sulfur dioxide may at least in part lead to a higher proportion of antioxidant present in the composition after a certain period of shelf life compared to compositions outside of the preferred pH range.

In some embodiments, the pH range of the composition after a certain period of shelf life does not change significantly from the initial pH of the composition. In some embodiments, the change in pH range may be no more than about 1 unit different than the initial pH of the composition, preferably no more than about 0.9 units, more preferably no more than about 0.8 units, more preferably no more than about 0.7 units, more preferably no more than about 0.6 units, more preferably no more than about 0.5 units, more preferably no more than about 0.4 units, more preferably no more than about 0.3 units, more preferably no more than about 0.2 units, most preferably no more than about 0.1 units. In some embodiments, the pH after a certain period of shelf life may not fall below 3.5.

In some embodiments, the pH range may be such that the composition conforms to the limit on total acidity imposed by the USP 37-NF 32, S2, monograph.

The present invention provides for compositions in single-dose and/or multi-dose formulations. In some embodiments, the composition may be contained in vials. In some embodiments, the vials may comprise clear glass, amber glass, or plastic. In some embodiments, the vials may be in the range of about 0.1 to 500 mL in volume, preferably in the range of about 0.5 to 250 mL, more preferably in the range of about 1 to 100 mL, and most preferably in the range of about 10 to 50 mL. In some embodiments, the composition may exist in a 1 mL vial. In some embodiments, the composition may exist in a 30 mL vial. In some embodiments, the 1 mL vial may be a single-dose formulation. In some embodiments, the 30 mL vial may be a multi-dose formulation. In some embodiments, the same vial may be used for multiple applications of the composition for up to about 10 days after initial use, preferably up to about 15 days, more preferably up to about 30 days, more preferably up to about 45 days, and most preferably up to about 60 days. In some embodiments, the composition may be lyophilized.

In some embodiments, the composition may be contained in an autoinjector.

The present invention also provides for methods of making pharmaceutical compositions of the present invention. In some embodiments of carrying out a method of making the present composition, a bulk solution may be produced as follows: water for injections, whose dissolved oxygen content is in an acceptable range as measured by a WFI USP/EP O_2 probe, may be added to a manufacturing tank kept under nitrogen pressure. Then, a tonicity regulating agent may be added and mixed. Then, a pH raising agent may be added to the solution while mixing. Then, a metal complexing agent may then be added to the solution while mixing. An antioxidant may then be added while mixing.

In another container equipped with a stir bar, a pH lowering agent may be combined with an active agent. The pH lowering agent and the active agent together may then be stirred using the stir bar in the separate container before the mixture is added to the manufacturing tank under nitrogen.

Then, the separate container may be rinsed with water for injections, whose dissolved oxygen content is in an acceptable range as measured by a WFI USP/EP O_2 probe, using a pipette and added to the manufacturing tank. This rinsing step may be repeated 1 to 3 more times. The solution may then mix before the final net weight of the solution is adjusted using water for injections.

The present invention also provides for methods of treating or reducing the symptoms associated with a medical condition, comprising administering to a subject in need thereof the pharmaceutical composition of the present invention.

Examples of conditions to be treated comprise bronchospasm, sensitivity reactions, cardiac arrhythmias, GI and renal hemorrhage, superficial bleeding, premature labor, hypoglycemia, and cardiogenic, hemorrhagic, and traumatic shock. In some embodiments, the present invention provides for methods for reducing the symptoms associated with allergic reactions (Type 1), including anaphylaxis, and/or for the induction and maintenance of mydriasis during intraocular surgery.

Examples of methods of administration comprise subcutaneous, intracameral, intravenous, and intramuscular injection, infusion, intra-arterial administration, intracardiac injection, endotracheal administration, intraosseous administration, oral inhalation, topical administration, and as ophthalmic irrigation.

Unless otherwise noted, all concentrations herein (other than percentage of impurities) are expressed as weight/volume percent (w/v %) of the composition.

The present invention is further described by way of the following non-limiting Examples that are given for illustrative purposes only.

Examples 1-18 represent example compositions according to the present invention.

Example 1

Ingredient	Concentration (mM)
Epinephrine	1-10
Tonicity regulating agent	75-150
Antioxidant	1-10
pH lowering agent	2-11
Transition metal complexing agent	0.1-15
Water	Fill to final total volume

Example 2

Ingredient	Concentration (mM)
Epinephrine	4-8
Tonicity regulating agent	90-140
Antioxidant	2-6
pH lowering agent	4-8
Transition metal complexing agent	0.2-2
Water	Fill to final total volume

Example 3

Ingredient	Concentration (mM)
Epinephrine	1-10
Sodium Chloride	75-150
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	2-11
Tetraethylenepentamine	0.1-15
Water	Fill to final total volume

Example 4

Ingredient	Concentration (mM)
Epinephrine	1-10
Sodium Chloride	75-150
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	2-11
Disodium Edetate Dihydrate	0.1-15
Water	Fill to final total volume

Example 5

Ingredient	Concentration (mM)
Epinephrine	1-10
Tonicity regulating agent	75-150
pH raising agent	10-70
Antioxidant	1-10
pH lowering agent	2-11
Water	Fill to final total volume

Example 6

Ingredient	Concentration (mM)
Epinephrine	4-8
Tonicity regulating agent	90-140
pH raising agent	30-50
Antioxidant	2-6
pH lowering agent	4-8
Water	Fill to final total volume

Example 7

Ingredient	Concentration (mM)
Epinephrine	3-11
Sodium Chloride	80-160
Tartaric Acid	7-21
Sodium Hydroxide	15-30
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	1-10
Water	Fill to final total volume

Example 8

Ingredient	Concentration (mg/mL)
Epinephrine	1-9
Sodium Chloride	1-10
Tartaric Acid	2-15
Sodium Hydroxide	1-5
Sodium Metabisulfite	1-12
Hydrochloric Acid 4% Solution	0-6 (mL/mL)
Water	Fill to final total volume

Example 9

Ingredient	Concentration (mM)
Epinephrine	1-15
Sodium Chloride	75-150
Lactic Acid	5-25
Sodium Hydroxide	15-30
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	1-10
Water	Fill to final total volume

Example 10

Ingredient	Concentration (mM)
Epinephrine	1-10
Tonicity regulating agent	75-150
pH raising agent	10-70
Antioxidant	1-10
pH lowering agent	2-11
Transition metal complexing agent	0.1-15
Water	Fill to final total volume

Example 11

Ingredient	Concentration (mM)
Epinephrine	4-8
Tonicity regulating agent	90-140
pH raising agent	30-50
Antioxidant	2-6
pH lowering agent	4-8
Transition metal complexing agent	0.2-2
Water	Fill to final total volume

Example 12

Ingredient	Concentration (mM)
Epinephrine	3-11
Sodium Chloride	80-160
Tartaric Acid	7-21
Sodium Hydroxide	15-30
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	1-10
Disodium Edetate Dihydrate	0-5
Water	Fill to final total volume

Example 13

Ingredient	Concentration (mM)
Epinephrine	1-15
Sodium Chloride	75-150
Lactic Acid	5-25
Sodium Hydroxide	15-30
Sodium Metabisulfite	1-10
Hydrochloric Acid 4% Solution	1-10
Disodium Edetate Dihydrate	0.5-8.5
Water	Fill to final total volume

Example 14

Ingredient	Concentration (mM)
Epinephrine	1-15
Sodium Chloride	50-150
Tartaric Acid	5-20
Sodium Hydroxide	15-30
Sodium Metabisulfite	3-18
Hydrochloric Acid 4% Solution	1-10
Tetraethylenepentamine	0.5-10.5
Water	Fill to final total volume

Example 15

Ingredient	Concentration (mM)
Epinephrine	1-10
Tonicity regulating agent	75-150
pH raising agent	10-70
Antioxidant	1-10
Preservative	10-50
pH lowering agent	2-11
Transition metal complexing agent	0.1-15
Water	Fill to final total volume

Example 16

Ingredient	Concentration (mM)
Epinephrine	4-8
Tonicity regulating agent	90-140
pH raising agent	30-50
Antioxidant	2-6
Preservative	20-40
pH lowering agent	4-8
Transition metal complexing agent	0.2-2
Water	Fill to final total volume

Example 17

Ingredient	Concentration (mg/mL)
Epinephrine	1-10
Sodium Chloride	4-12
Lactic Acid	0.5-15
Sodium Hydroxide	1-5

-continued

Ingredient	Concentration (mg/mL)
Sodium Metabisulfite	0.1-10.1
Chlorobutanol, hydrous	3-12
Hydrochloric Acid 4% Solution	0.1-5 (mL/mL)
Disodium Edetate Dihydrate	1-15
Water	Fill to final total volume

Example 18

Ingredient	Concentration (mM)
Epinephrine	1-15
Sodium Chloride	50-150
Tartaric Acid	5-20
Sodium Hydroxide	15-30
Sodium Metabisulfite	3-18
Chlorobutanol, hydrous	10-30
Hydrochloric Acid 4% Solution	1-10
Tetraethylenepentamine	0.5-10.5
Water	Fill to final total volume

What is claimed is:

1. A method of treating a condition comprising administering to a patient in need thereof a composition comprising:

in the range of about 0.5 to 1.5 mg/mL of epinephrine and/or salts thereof,

in the range of about 6 to 8 mg/mL of a tonicity regulating agent,

in the range of about 2.8 to 3.8 mg/mL of a pH raising agent,

in the range of about 0.1 to 1.1 mg/mL of an antioxidant,

in the range of about 0.001 to 0.010 mL/mL of a pH lowering agent, and

in the range of about 0.01 to 0.4 mg/mL of a transition metal complexing agent;

wherein the antioxidant comprises sodium bisulfite and/or sodium metabisulfite, and

wherein the condition is selected from the group consisting of anaphylaxis, bronchospasm, sensitivity reactions, cardiac arrhythmias, GI and renal hemorrhage, superficial bleeding, premature labor, hypoglycemia, and cardiogenic, hemorrhagic, and traumatic shock.

2. The method of claim **1**, wherein the tonicity regulating agent comprises sodium chloride.

3. The method of claim **1**, wherein the pH raising agent comprises a buffer system comprising at least two compounds.

4. The method of claim **1**, wherein the pH raising agent comprises at least one of tartaric acid and sodium hydroxide.

5. The method of claim **1**, wherein the pH lowering agent comprises hydrochloric acid.

6. The method of claim **1**, wherein the transition metal complexing agent comprises EDTA.

7. The method of claim **1**, wherein the composition further comprises a preservative.

8. The method of claim **7**, wherein the preservative comprises chlorobutanol.

9. The method of claim **7**, wherein the preservative is present at a concentration of in the range of about 4.75 to 5.75 mg/mL.

10. The method of claim **1**, wherein the composition further comprises a solvent.

11. The method of claim 10, wherein the solvent comprises water.

12. The method according to claim 1, wherein the composition comprises about 17% or less total impurities after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH,

wherein the impurities comprise epinephrine sulfonic acid (ESA), D-epinephrine, Impurity A, Impurity B, and Unknown C.

13. The method according to claim 1, wherein the composition comprises about 16% or less total impurities after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH,

wherein the impurities comprise epinephrine sulfonic acid (ESA), D-epinephrine, Impurity A, Impurity B, and Unknown C.

14. The method of claim 1, wherein the composition comprises about 11% or less of ESA after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

15. The method of claim 1, wherein the composition comprises about 3% or less of D-Epinephrine after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

16. The method of claim 1, wherein the composition comprises about 1% or less of Impurity A after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

17. The method of claim 1, wherein the composition comprises about 1% or less of Impurity B after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

18. The method of claim 1, wherein the composition comprises about 1% or less of Unknown C after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

19. The method of claim 1, wherein the composition does not undergo unacceptable color change after 18 months of storage at between 23° C. and 32° C. and between 55% RH and 70% RH.

20. A method for treating Type 1 allergic reactions comprising administering to a patient in need thereof a composition comprising:

in the range of about 0.5 to 1.5 mg/mL of epinephrine and/or salts thereof,

in the range of about 6 to 8 mg/mL of a tonicity regulating agent,

in the range of about 2.8 to 3.8 mg/mL of a pH raising agent,

in the range of about 0.1 to 1.1 mg/mL of an antioxidant,

in the range of about 0.001 to 0.010 mL/mL of a pH lowering agent, and

in the range of about 0.01 to 0.4 mg/mL of a transition metal complexing agent;

wherein the antioxidant comprises sodium bisulfite and/or sodium metabisulfite.

21. A method for the induction and maintenance of mydriasis during intraocular surgery comprising administering to a patient in need thereof a composition comprising:

in the range of about 0.5 to 1.5 mg/mL of epinephrine and/or salts thereof,

in the range of about 6 to 8 mg/mL of a tonicity regulating agent,

in the range of about 2.8 to 3.8 mg/mL of a pH raising agent,

in the range of about 0.1 to 1.1 mg/mL of an antioxidant,

in the range of about 0.001 to 0.010 mL/mL of a pH lowering agent, and

in the range of about 0.01 to 0.4 mg/mL of a transition metal complexing agent;

wherein the antioxidant comprises sodium bisulfite and/or sodium metabisulfite.
