12 UNITED STATES DISTRICT COURT
 13 NORTHERN DISTRICT OF CALIFORNIA
 14 SAN JOSE DIVISION

15 IN RE PERSONALWEB TECHNOLOGIES,
 16 LLC, ET AL., PATENT LITIGATION

CASE NO.: 5:18-md-02834-BLF

FIRST AMENDED COMPLAINT

DEMAND FOR JURY TRIAL

19 PERSONALWEB TECHNOLOGIES, LLC, a
 20 Texas limited liability company, and
 LEVEL 3 COMMUNICATIONS, LLC,
 21 a Delaware limited liability company,

Case No.: 5:18-cv-05373-BLF

22 Plaintiffs,

23 v.

24 DOLLAR SHAVE CLUB, INC., a Delaware
 25 corporation,

26 Defendant.

1 Plaintiff PersonalWeb Technologies, LLC (“Plaintiff” or “PersonalWeb”) files this First
2 Amended Complaint (“Complaint”) for patent infringement against Defendant Dollar Shave Club, Inc.
3 (“Defendant”). Plaintiff PersonalWeb Technologies, LLC alleges:

4
5 **PRELIMINARY STATEMENT**

6 1. PersonalWeb and Level 3 Communications, LLC (“Level 3”) are parties to an
7 agreement between Kinetech, Inc. and Digital Island, Inc. dated September 1, 2000 (the “Agreement”).
8 Pursuant to the Agreement, PersonalWeb and Level 3 each own a fifty percent (50%) undivided
9 interest in and to the patents at issue in this action: U.S. Patent Nos. 6,928,442, 7,802,310, 7,945,544,
10 and 8,099,420 (“Patents-in-Suit”). Level 3 has joined in this Complaint pursuant to its contractual
11 obligations under the Agreement, at the request of PersonalWeb.

12 2. Pursuant to the Agreement, Level 3 has, among other rights, certain defined rights to
13 use, practice, license, sublicense and enforce and/or litigate the Patents-in-Suit in connection with a
14 particular field of use (“Level 3 Exclusive Field”). Pursuant to the Agreement PersonalWeb has,
15 among other rights, certain defined rights to use, practice, license, sublicense, enforce and/or litigate
16 the Patents-in-Suit in fields other than the Level 3 Exclusive Field (the “PersonalWeb Patent Field”).

17 3. All infringement allegations, statements describing PersonalWeb, statements
18 describing any Defendant (or any Defendant’s products) and any statements made regarding
19 jurisdiction and venue are made by PersonalWeb alone, and not by Level 3. PersonalWeb alleges that
20 the infringements at issue in this case all occur within, and are limited to, the PersonalWeb Patent
21 Field. Accordingly, PersonalWeb has not provided notice to Level 3—under Section 6.4.1 of the
22 Agreement or otherwise—that PersonalWeb desires to bring suit in the Level 3 Exclusive Field in its
23 own name on its own behalf or that PersonalWeb knows or suspects that Defendant is infringing or
24 has infringed any of Level 3’s rights in the patents.

THE PARTIES

1
2 4. Plaintiff PersonalWeb Technologies, LLC is a limited liability company duly organized
3 and existing under the laws of Texas with its principal place of business at 112 E. Line Street, Suite
4 204, Tyler, TX 75702.

5 5. Plaintiff Level 3 Communications, LLC is a limited liability company organized under
6 the laws of Delaware with its principal place of business at 100 CenturyLink Drive, Monroe,
7 Louisiana, 71203.

8 6. PersonalWeb’s infringement claims asserted in this case are asserted by PersonalWeb
9 and all fall outside the Level 3 Exclusive Field. Level 3 is currently not asserting patent infringement
10 in this case in the Level 3 Exclusive Field against any Defendant.

11 7. Defendant Dollar Shave Club, Inc. is, upon information and belief, a Delaware
12 corporation having a principal place of business and regular and established place of business at 13335
13 Maxella Avenue, Marina del Rey, California 90292.

14
15 **JURISDICTION AND VENUE**

16 8. The court has subject matter jurisdiction pursuant to 28 U.S.C. §§ 1331 and 1338(a)
17 because this action arises under the patent laws of the United States, 35 U.S.C. § 1 *et seq.*

18 9. Venue is proper in this federal district pursuant to 28 U.S.C. §§ 1391(b)–(c) and
19 1400(b) because Defendant is incorporated in the State of Delaware, and on information and belief,
20 Defendant has a regular and established place of business in this District and has committed acts of
21 infringement in this District.

22 10. This court has personal jurisdiction over Defendant because, in addition to the
23 allegations in above paragraphs, on information and belief, Defendant is domiciled in this District.
24 Further, on information and belief, Defendant purposefully directed activities at residents of
25 California, the claims herein arise out of and relate to those activities, and assertion of personal
26 jurisdiction over Defendant would be fair.

PERSONALWEB BACKGROUND

1
2 11. The Patents-in-Suit cover fundamental aspects of cloud computing, including the
3 identification of files or data and the efficient retrieval thereof in a manner which reduces bandwidth
4 transmission and storage requirements.

5 12. The ability to reliably identify and access specific data is essential to any computer
6 system or network. On a single computer or within a small network, the task is relatively easy: simply
7 name the file, identify it by that name and its stored location on the computer or within the network,
8 and access it by name and location. Early operating systems facilitated this approach with standardized
9 naming conventions, storage device identifiers, and folder structures.

10 13. Ronald Lachman and David Farber, the inventors of the Patents-in-Suit, recognized
11 that the conventional approach for naming, locating, and accessing data in computer networks could
12 not keep pace with ever-expanding, global data processing networks. New distributed storage systems
13 use files that are stored across different devices in dispersed geographic locations. These different
14 locations could use dissimilar conventions for identifying storage devices and data partitions.
15 Likewise, different users could give identical names to different files or parts of files—or unknowingly
16 give different names to identical files. No solution existed to ensure that identical file names referred
17 to the same data, and conversely, that different file names referred to different data. As a result,
18 expanding networks could not only become clogged with duplicate data, they also made locating and
19 controlling access to stored data more difficult.

20 14. Lachman and Farber developed a solution: replacing conventional naming and storing
21 conventions with system-wide “substantially unique,” content-based identifiers. Their approach
22 assigned substantially unique identifiers to “data items” of any type: “the contents of a file, a portion
23 of a file, a page in memory, an object in an object-oriented program, a digital message, a digital
24 scanned image, a part of a video or audio signal, or any other entity which can be represented by a
25 sequence of bits.” Applied system-wide, this invention would permit any data item to be stored,
26 located, managed, synchronized, and accessed using its content-based identifier.

27 15. To create a substantially unique, content-based identifier, Lachman and Farber turned
28 to cryptography. Cryptographic hash functions, including MD4, MD5, and SHA, had been used in

1 computer systems to verify the integrity of retrieved data—a so-called “checksum.” Lachman and
2 Farber recognized that these same hash functions could be devoted to a vital new purpose: if a
3 cryptographic hash function was applied to a sequence of bits (a “data item”), it would produce a
4 substantially unique result value, one that: (1) virtually guarantees a different result value if the data
5 item is changed; (2) is computationally difficult to reproduce with a different sequence of bits; and
6 (3) cannot be used to recreate the original sequence of bits.

7 16. These cryptographic hash functions would thus assign any sequence of bits, based on
8 content alone, with a substantially unique identifier. Lachman and Farber estimated that the odds of
9 these hash functions producing the same identifier for two different sequences of bits (i.e., the
10 “probability of collision”) would be about 1 in 2 to the 29th power. Lachman and Farber dubbed their
11 content-based identifier a “True Name.”

12 17. Using a True Name, Lachman and Farber conceived various data structures and
13 methods for managing data (each data item correlated with a single True Name) within a network—
14 no matter the complexity of the data or the network. These data structures provide a key-map
15 organization, allowing for a rapid identification of any particular data item anywhere in a network by
16 comparing a True Name for the data item against other True Names for data items already in the
17 network. In operation, managing data using True Names allows a user to determine the location of
18 any data in a network, determine whether access is authorized, and to selectively provide access to
19 specific content not possible using the conventional naming arts.

20 18. On April 11, 1995, Lachman and Farber filed their patent application, describing these
21 and other ways in which content-based “True Names” elevated data-processing systems over
22 conventional file-naming systems. The first True Name patent issued on November 2, 1999. The last
23 of the Patents-in-Suit has expired, and the allegations herein are directed to the time period before
24 expiration of the last of the Patents-in-Suit.

25 19. PersonalWeb has successfully enforced its intellectual property rights against third
26 party infringers, and its enforcement of the Patents-In Suit is ongoing. This enforcement has resulted
27 in PersonalWeb obtaining settlements and granting non-exclusive licenses regarding the Patents-in-
28 Suit.

GENERAL BACKGROUND

1
2 20. A webpage is a type of document that is typically retrieved over the World Wide Web,
3 made viewable and formatted (rendered) by a web browser, and displayed electronically. A “webpage”
4 often refers to what is visible in a browser, but sometimes also refers to a computer file (“webpage
5 base file”), usually written in Hypertext Markup Language (“HTML”) or a comparable markup
6 language. Such HTML webpage base files typically include text, formatting, and references
7 (hyperlinks) to other web content, such as style sheets, scripts, and images that make up part of the
8 webpage. Web content referenced in an HTML or similar file are also called “asset files” herein. The
9 web browser coordinates the retrieval of the various asset files of a webpage and renders the webpage
10 for display from the webpage base file and the asset files referenced in the webpage base file or
11 referenced in other asset files.

12 21. On the World Wide Web, hyperlinks generally include Uniform Resource Identifiers
13 (“URIs”), which each typically include an address of a server (“host”) from which the asset file is to
14 be retrieved (*e.g.*, “www.website.com”), a “path” to the location of that asset file on the host server
15 (*e.g.*, “/directory/”), and a filename (*e.g.*, “filename.ext”).

16 22. On the Internet, a web browser typically retrieves a webpage base file from a remote
17 web server and retrieves referenced asset files from the same or different servers. The web browser
18 retrieves a webpage base file or an asset file by making a GET “request” to a web server using the
19 Hypertext Transfer Protocol (“HTTP”), an industry standard. The web server may respond to such an
20 HTTP request with a HTTP “response” that includes the requested web content and may include other
21 information or instructions.

22 23. A static webpage is delivered exactly as stored, as web content in the web server’s file
23 system or memory. In contrast, a dynamic webpage is generated by a web server application, usually
24 driven by server-side software, upon receipt of a request from a browser (user). For example, a picture
25 of a building might be delivered as static content (a picture) whereas the latest traffic conditions may
26 be delivered dynamically based on real time traffic information.

27 24. The speed of a browser retrieving webpage base files and incorporated asset files can
28 be increased by the browser storing previously retrieved webpage base files and asset files in a browser

1 “cache” on the computer running the browser. If a browser’s user later requests a previously retrieved
2 webpage base file or requests a webpage that includes an asset file previously used by the browser in
3 rendering the same or a different webpage (for example, by reloading a webpage or visiting the same
4 webpage again), the browser may use the cached webpage base file or asset file rather than having to
5 download the same file repeatedly over the Internet again.

6 25. Two computers communicating over the Internet usually are not directly connected to
7 each other but rather interact via chains of network appliances and other computers (*e.g.*, “switches”
8 and “intermediate” servers). Many intermediate servers have caches similar to and complementing
9 the browser cache that store webpage base files and assets that pass through that intermediate server.
10 If a browser or server requests a file from the intermediate server that is present in that intermediate
11 server’s cache, the intermediate server can use the content in its cache to respond to the request rather
12 than send the request upstream towards the web server from which the file initially originated (also
13 called the “origin server”).

14 26. Responses to HTTP requests may include header elements (control elements) and a
15 body (the “object” that was requested). Under HTTP, web servers can include a “cache-control”
16 header with a response that includes a webpage or asset file. A “cache-control” header includes one
17 or more directives that instruct browsers and intermediate server caches (“intermediate caches”) as to
18 whether and for how long the file (object) included in the response may be cached or under what
19 circumstances and under what conditions the cached content may be used. HTTP also provides for
20 including other headers in responses that provide similar types of instructions to browsers and
21 intermediate caches. Collectively, these other headers and directives in a “cache-control” header are
22 referred to herein as “cache-control headers.”

23 27. Given that webpage content changes, sometimes rather quickly and regularly, a
24 problem that website owners face is effectively instructing a browser that is re-rendering a previously
25 cached webpage that one or more of its cached files for that webpage are no longer the correct and
26 authorized content (the content of those files has changed) and similarly reauthorizing the use of those
27 cached files whose content has not changed.
28

1 files of Defendant and to instruct them to obtain newly authorized content in rendering Defendant's
2 webpage when that content had changed. In other words, whether the previously cached content was
3 still considered valid for use by the Defendant website operator.

4 34. On information and belief, Defendant thereby reduced the bandwidth and computation
5 required by its origin servers and any intermediate cache servers to field user requests to render
6 Defendant's webpages as those servers only need to serve files whose content has changed. On
7 information and belief, this has allowed for the efficient update of cached information only when such
8 content has changed, thereby reducing transaction overhead and bandwidth and allowing the
9 authorized content to be served from the nearest cache.

10 35. More particularly, on information and belief, each of Defendant's webpages included
11 a webpage base file (*e.g.*, a main or initial HTML file) and one or more asset files referenced in the
12 webpage base file (or referenced in other asset files that contained references to other asset files). On
13 information and belief, the references in the webpage base file to the asset files needed to render the
14 webpage were typically Uniform Resource Identifiers ("URIs"), which each typically included a
15 filename, the address of a host server from which the asset file could be retrieved, and a "path" to the
16 location of that asset file on that server.

17 36. On information and belief, Defendant's website used a web application framework to
18 develop and compile various webpages of the Defendant, including asset files that were used in
19 rendering the webpages, and to generate fingerprints of the contents of asset files. On information and
20 belief, the fingerprints of individual asset files that were part of the webpage's content were included
21 in the respective filenames of the individual asset files. On information and belief, the modified
22 filenames were then used as part of the URI used to access the individual asset files over the Internet.
23 On information and belief, when an asset file's content was changed, a new fingerprint was generated
24 and included in the filename, its URI thus being changed accordingly.

25 37. On information and belief, the asset file fingerprint was generated with a hash function
26 and used to identify content changes. Furthermore, on information and belief, asset file URIs (with
27 respective fingerprints) were included in webpage base files or other asset files contained references
28 to other asset files. On information and belief, static webpage base files, if any, were recompiled when

1 any URI of a referenced asset file was changed (due to the fingerprint of the referenced asset file
2 changing). Thus, a content change in an asset file for a given webpage would result in a change to its
3 fingerprint, its URI, and a subsequent change to the content of any static webpage base files
4 referencing that changed asset file for that webpage.

5 38. On information and belief, a dynamic webpage base file generated for a webpage of
6 Defendant webpages in response to one request from a user could be the same as it was when it was
7 generated in response to a prior request from that or another user. However, on information and belief,
8 this would not be the case if any of the asset files referenced in the webpage base file had changed
9 between the time of the two requests and the URIs of the changed asset files included fingerprints as
10 described above.

11 39. On information and belief, when an asset file's content was changed, a new fingerprint
12 was generated and included in the filename, and its URI was thus changed accordingly, resulting in a
13 content change to any webpage base file or other asset file that referenced that URI. This, in turn,
14 caused a new and different ETag being generated for such webpage base file or other asset file that
15 referenced that URI.

16 40. On information and belief, for at least one of the asset files ("CBI ETag asset files"),
17 the asset file comprised a sequence of bits and an associated ETag value was generated by Defendant
18 by applying a hash function to the sequence of bits; wherein any two CBI ETag asset files comprising
19 identical sequences of bits had identical associated ETag values. Thus, on information and belief,
20 when a CBI ETag asset file's content was changed a new associated ETag value was generated by
21 Defendant. On information and belief, Defendant caused the origin server for each CBI ETag asset
22 file to serve such CBI ETag asset file with its associated Etag value in response to HTTP GET requests
23 for the CBI ETag asset file.

24 41. On information and belief, when Defendant created a webpage base file for a webpage,
25 whether dynamic or static, that webpage base file included a sequence of bits and an associated ETag
26 value was generated by Defendant by applying a hash function to the sequence of bits; wherein any
27 two webpage base files comprising identical sequences of bits had identical associated ETag values.
28 Thus, on information and belief, when a webpage base file's content was changed and a new associated

1 ETag value was generated by Defendant, it thereafter instructed the respective service by intermediate
2 cache servers or use by endpoint caches such as browser caches to no longer use the previous cached
3 webpage base file's content. Conversely, when the webpage base file content had not changed and
4 thus its ETag was unchanged, the cached asset files with fingerprints in their URIs referenced in the
5 webpage base file had not changed and were still valid to use.

6 42. On information and belief, when an intermediate cache server or a browser requested
7 a webpage from the Defendant for the first time, it sent an HTTP GET request with the webpage's
8 URI and Defendant's origin server or an upstream cache server responded by sending an HTTP 200
9 (OK) response message containing the webpage base file, along with its respective associated ETag.

10 On information and belief, a browser then sent individual HTTP GET requests, each with an asset
11 file's URI that was referenced in the webpage base file, and the asset files' origin servers or
12 intermediate cache servers responded by sending individual HTTP 200 responses containing the
13 requested asset files, along with, if available, their respective associated ETags. On information and
14 belief, upon receipt of the HTTP 200 responses, the intermediate cache server or browser cached the
15 webpage base file and asset files with their associated URI and associated ETag values and the browser
16 used them in rendering the requested web page of the Defendant. On information and belief, the origin
17 servers, intermediate cache servers, and browser caches were caused to maintain databases/tables
18 which mapped the URIs of webpage base files and asset files to their respective responses and, if
19 applicable, associated cache-control headers and ETags.

20 43. On information and belief, by responding to an HTTP GET request for a given webpage
21 by transmitting content of a webpage base file or asset file with an associated ETag, Defendant
22 instructed the browser cache and all intermediate cache servers, to use an HTTP conditional GET
23 request the next time that webpage base file or asset file is requested. More specifically, on information
24 and belief, the browser or intermediate cache is instructed to include the ETag in the HTTP conditional
25 GET request with an "If-None-Match" header to re-verify that they are still authorized to serve or use
26 that content or determine that they are no longer authorized to use that content and therefore must use
27 new content.

28

1 44. On information and belief, Defendant did this, for example, by causing cache-control
2 headers to be included in HTTP responses containing its webpage base file or asset files. On
3 information and belief, Defendant benefits from using the ETags to control the distribution of its
4 webpage content by communicating to a downstream cache and to a browser which of Defendant's
5 cached webpage base files it is reauthorized to serve/use and what newly authorized files it must first
6 obtain in serving/rendering Defendant's webpages.

7 45. More particularly, on information and belief, when a browser again requested the
8 Defendant's webpage, the browser either used a cached copy, if allowed by the cache-control headers,
9 or retrieved a new copy of the webpage base file for Defendant's webpage. Similarly, on information
10 and belief, for asset files referenced in the new or cached webpage base file, the browser either used a
11 cached copy, if allowed by the cache-control headers, or retrieved a new copy of the asset files for
12 Defendant's webpage.

13 46. On information and belief, for a webpage base file or an asset file stored in the
14 browser's cache with an ETag, and based on the cache-control headers received in the original
15 response, the browser sent a conditional GET request with an If-None-Match header using the
16 associated ETag value and the URI for the webpage base file or asset file so as to be notified whether
17 the browser still had Defendant's authority to render the webpage with its locally cached webpage
18 base file or asset file. In other words, whether the cached content was still valid for use in rendering
19 Defendant's webpage.

20 47. On information and belief, under most circumstances, a responding intermediate cache
21 server having content cached for the URI in the conditional GET request and having an ETag for that
22 URI responded to the request by determining whether it had the same associated ETag value for that
23 URI. If it had no ETag value for that URI, on information and belief, the request was passed up to an
24 upstream intermediate cache server capable of responding or, if none, to the URI's origin server, which
25 responded to the request. On information and belief, if the intermediate cache server did not have
26 content cached for the URI in the conditional GET request, the request was similarly passed up to an
27 upstream intermediate cache server capable of responding or, if none, to the URI's origin server.
28

1 48. On information and belief, if the responding server had the webpage content for that
2 URI and there was a match between the ETag it received in the request with the ETag it currently had
3 associated for that URI, it sent back an HTTP 304 (Not Modified) response message; this message
4 notifying the browser that the same webpage content was present at the responding server and that the
5 browser was still authorized to use that previously cached webpage base file or asset file to render the
6 webpage. On information and belief, upon receipt of the HTTP 304 response, the browser accessed
7 the locally cached webpage base file or asset file in rendering the webpage.

8 49. On information and belief, if the webpage base file's or asset file's associated ETag
9 sent by the browser in the conditional GET If-None-Match request did not match the associated ETag
10 maintained at the responding server (or other intermediate cache servers further upstream or the origin
11 server) for that URI, the responding server sent back an HTTP 200 response along with the new
12 webpage base file or asset file and its new ETag value. The HTTP 200 response indicated to the
13 browser that it was not authorized to use (or serve, in the case of an intermediate cache server receiving
14 the HTTP 200 response) the previously cached webpage base file or asset file. In response to receiving
15 the HTTP 200 response, the browser (or intermediate cache server) was instructed to update its
16 respective cache with the new webpage base file or asset file and associated ETag. The browser
17 subsequently used the new webpage base file (and the asset file URIs contained therein) or asset file
18 to render the webpage.

19 50. Exhibit 1 to the complaint lists specific examples of files that were, on information and
20 belief, served by or on behalf of Defendant during the relevant time period. The examples in Exhibit
21 1 include: a webpage base file served with a content-based ETag for the webpage base file; an asset
22 file with a content-based ETag for that asset file; and an asset file referenced by a URI with a
23 fingerprint of the asset file contained into the URI.

24 51. On information and belief, in this manner, Defendant used (1) ETag values and (2)
25 asset files referenced by URIs with fingerprints based on the asset files' content to control the behavior
26 of downstream intermediate cache servers and browser caches to assure that they only accessed and
27 used Defendant's latest authorized webpage content to serve or to render its webpages.

28

FIRST CLAIM FOR RELIEF

INFRINGEMENT OF U.S. PATENT NO. 6,928,442

1
2
3 52. PersonalWeb repeats and realleges paragraphs 1–51, as if the same were fully stated
4 herein.

5 53. On August 9, 2005, United States Patent No. 6,928,442 (the “’442 patent”) was duly
6 and legally issued for an invention entitled “Enforcement and Policing of Licensed Content Using
7 Content-Based Identifiers.” PersonalWeb has an ownership interest in the ’442 patent by assignment,
8 including the exclusive right to enforce the ’442 patent within the PersonalWeb Patent Field, and
9 continues to hold that ownership interest in the ’442 patent.

10 54. Defendant has infringed at least claims 10 and 11 of the ’442 patent by its manufacture,
11 use, sale, importation, and/or offer for sale of products or services, and/or controlling the distribution
12 of its webpage content in the manner described herein. Defendant’s infringement is literal and/or
13 under the doctrine of equivalents and Defendant is liable for its infringement of the ’442 patent
14 pursuant to 35 U.S.C. § 271.

15 55. For example, claim 10 covers “a method, in a system in which a plurality of files are
16 distributed across a plurality of computers.” On information and belief, Defendant has used a system
17 of notifications and authorizations to distribute a plurality of files, *e.g.*, Defendant’s files containing
18 content necessary to render its webpages, across a plurality of computers such as production servers,
19 origin servers, intermediate cache servers and endpoint caches used by browsers rendering
20 Defendant’s webpages.

21 56. Claim 10 then recites the act of “obtaining a name for a data file, the name being based
22 at least in part on a given function of the data, wherein the data used by the function comprises the
23 contents of the particular file.” As set forth above, on information and belief, Defendant generated or
24 otherwise obtained ETags for its webpage base file and asset files used to render its webpages using a
25 hash function, wherein the ETags were based on the contents of the particular files. Moreover,
26 Defendant caused the intermediate caches servers and endpoint caches to obtain the ETags in HTTP
27 200 responses sent from Defendant’s origin servers. On information and belief, Defendant caused
28

1 intermediate cache servers and its origin servers to obtain ETags in conditional GET messages from
2 endpoint and intermediate caches, as described *supra*.

3 57. Claim 10 then recites the act of “determining, using at least the name, whether a copy
4 of the data file is present on at least one of said computers.” On information and belief, as set forth
5 above, Defendant has caused its origin servers and the intermediate cache servers between an endpoint
6 cache and one of its origin servers to, in response to receiving a conditional GET request with an If-
7 None-Match header, determine whether it has a file present that matches the URI in the conditional
8 GET and to compare the ETag in the conditional GET to the ETag for that URI and determine whether
9 a copy of the content having that ETag is present.

10 58. Claim 10 then recites the act of “determining whether a copy of the data file that is
11 present on a at least one of said computers is an unauthorized copy or an unlicensed copy of the data
12 file.” On information and belief, as set forth above, if there was a match, the origin or intermediate
13 cache server determined that the copy of the file present at the downstream intermediate cache server
14 and/or the endpoint cache was an authorized or licensed copy of the data file. Conversely, if there was
15 no match, it determined that the copy of the file present at the downstream intermediate cache server
16 and/or the endpoint cache was an unauthorized copy of the data file. Likewise, if the browser
17 determined that it had a file with a matching URI, the browser determined that it was still authorized
18 to use that file.

19 59. Defendant’s acts of infringement caused damage to PersonalWeb and PersonalWeb is
20 entitled to recover from Defendant the damages sustained by PersonalWeb as a result of Defendant’s
21 wrongful acts in an amount subject to proof at trial.

22 **SECOND CLAIM FOR RELIEF**

23 **INFRINGEMENT OF U.S. PATENT NO. 7,802,310**

24 60. PersonalWeb repeats and realleges paragraphs 1–51, as if the same were fully stated
25 herein.

26 61. On September 21, 2010, United States Patent No. 7,802,310 (the “310 patent”) was
27 duly and legally issued for an invention entitled “Controlling Access to Data in a Data Processing
28

1 System.” PersonalWeb has an ownership interest in the ’310 patent by assignment, including the
2 exclusive right to enforce the ’310 patent within the PersonalWeb Patent Field, and continues to hold
3 that ownership interest in the ’310 patent.

4 62. Defendant has infringed at least claims 20 and 69 of the ’310 patent by its manufacture,
5 use, sale, importation, and/or offer for sale of products or services, and/or controlling the distribution
6 of its webpage content in the manner described herein. Defendant’s infringement is literal and/or
7 under the doctrine of equivalents and Defendant is liable for its infringement of the ’310 patent
8 pursuant to 35 U.S.C. § 271.

9 63. For example, claim 20 covers a “computer-implemented method operable in a system
10 which includes a plurality of computers.” On information and belief, Defendant used the claimed
11 computer implemented method by using a system of notifications and authorizations to control the
12 distribution of data items, such as various webpage base file and asset files, necessary to render its
13 webpages, across a plurality of computers such as production servers, origin servers, intermediate
14 cache servers, and endpoint caches.

15 64. Claim 20 then recites “controlling distribution of content from a first computer to at
16 least one other computer, in response to a request obtained by a first device in the system from a second
17 device in the system, the first device comprising hardware including at least one processor, the request
18 including at least a content-dependent name of a particular data item, the content-dependent name
19 being based at least in part on a function of at least some of the data comprising the particular data
20 item, wherein the function comprises a message digest function or a hash function, and wherein two
21 identical data items will have the same content-dependent name.” On information and belief, as set
22 forth above, Defendant has caused downstream intermediate cache servers and endpoint caches to
23 send conditional GET requests with If-None-Match headers containing ETags that are fielded by
24 upstream cache or origin servers. On information and belief, the ETags were content-dependent names
25 for a data item based on hashing the data item’s contents; and when the file’s content changed a new
26 content-dependent name was determined. On information and belief, in Defendant’s method, a first
27 computer, such as the intermediate cache server or origin server, received such conditional GET
28 requests from a second computer, such as a user browser or other intermediate cache server, regarding

1 data items, such as webpage or asset files, the requests including ETags associated with the respective
2 data items.

3 65. Claim 20 then recites “based at least in part on said content-dependent name of said
4 particular data item, the first device (A) permitting the content to be provided to or accessed by the at
5 least one other computer if it is not determined that the content is unauthorized or unlicensed,
6 otherwise, (B) if it is determined that the content is unauthorized or unlicensed, not permitting the
7 content to be provided to or accessed by the at least one other computer.” On information and belief,
8 the first computer, such as an upstream intermediate cache server or origin server, maintained a
9 plurality of ETags associated with Defendant’s asset and webpage base files. On information and
10 belief, the ETag in a request and the ETag maintained by the first computer for the particular data item
11 sought by the request were compared to determine whether the associated content present at the
12 downstream computer was still authorized to be used/served or whether new authorized content must
13 be provided thereto. If it was determined that the data item corresponding to the received ETag was
14 still authorized to be used, the first computer sent back an HTTP 304 response authorizing the
15 downstream cache server or end-user cache to access the file content already present in order to serve
16 it or to use it to render the webpage. On information and belief, if it had been determined that the data
17 item corresponding to received E-tag was no longer authorized, the first computer sent back an HTTP
18 200 response which indicated to the downstream cache server or end-user cache that was not
19 authorized to access the old content and must access the new authorized file content contained in the
20 HTTP 200 response to serve it or to use it to render the webpage.

21 66. For a further example, claim 69 covers a “system operable in a network of computers,
22 the system comprising hardware including at least a processor, and software, in combination with said
23 hardware.” On information and belief, Defendant has controlled the distribution of its website content
24 across a system that included a network of computers, such as its production servers as well as origin
25 servers, intermediate cache servers, and endpoint caches, all comprising hardware including a
26 processor. On information and belief, Defendant has utilized software, in combination with such
27 hardware, such as a web development framework, software utilized in implementing the HTTP web
28 protocol, and software used on host servers that Defendant used to serve its content.

1 67. Claim 69 then recites the system “(a) to receive at a first computer, from a second
2 computer, a request regarding a data item, said request including at least a content-dependent name
3 for the data item, the content-dependent name being based at least in part on a function of the data in
4 the data item, wherein the data used by the function to determine the content-dependent name
5 comprises at least some of the contents of the data item, wherein the function that was used is a
6 message digest function or a hash function, and wherein two identical data items will have the same
7 content-dependent name.” On information and belief, as set forth above, Defendant has caused
8 downstream intermediate cache servers and endpoint caches to send conditional GET requests with
9 URIs including fingerprints that are fielded by upstream cache or origin servers. On information and
10 belief, the URIs including fingerprints were content-dependent names for a data item calculated by
11 hashing the file’s contents; and when the file’s content changed a new content-dependent name was
12 determined. On information and belief, in Defendant’s system, a first computer, such as the
13 intermediate cache server or origin server, received such conditional GET requests from a second
14 computer, such as a user browser, regarding data items, such as asset files, using content-dependent
15 names such as URIs including fingerprints associated with the data items.

16 68. Claim 69 then recites “(b) in response to said request: (i) to cause the content-dependent
17 name of the data item to be compared to a plurality of values; and (ii) to determine if access to the data
18 item is authorized or unauthorized based on whether or not the content-dependent name corresponds
19 to at least one of said plurality of values, and (iii) based on whether or not it is determined that access
20 to the data item is authorized or unauthorized, to allow the data item to be provided to or accessed by
21 the second computer if it is not determined that access to the data item is unauthorized.” On
22 information and belief, the first computer, such as an upstream intermediate cache server or origin
23 server, maintained a plurality of URI values associated with Defendant’s asset and webpage base files;
24 compared the URI value received in a conditional GET request from the second (downstream)
25 computer to that plurality of URI values; that comparison allowed the first computer to determine
26 whether the content-dependent name in the request corresponded to one of the plurality of stored URI
27 values and to determine whether access to the data item was still authorized or not. On information
28 and belief, in particular when there was a match, the first computer determined the associated content

1 present at the downstream computer was still authorized to be used/served or whether new authorized
2 content must be provided thereto. If it was determined that the data item corresponding to the received
3 URI including a fingerprint was still authorized to be used, the first computer has sent back an HTTP
4 304 response authorizing the downstream cache server or end-user cache to access the file content
5 already present in order to serve it or to use it to render the webpage.

6 69. Defendant's acts of infringement have caused damage to PersonalWeb and
7 PersonalWeb is entitled to recover from Defendant the damages sustained by PersonalWeb as a result
8 of Defendant's wrongful acts in an amount subject to proof at trial.

9
10 **THIRD CLAIM FOR RELIEF**

11 **INFRINGEMENT OF U.S. PATENT NO. 7,945,544**

12 70. PersonalWeb repeats and realleges paragraphs 1–51, as if the same were fully stated
13 herein.

14 71. On May 17, 2011, United States Patent No. 7,945,544 (the "'544 patent") was duly and
15 legally issued for an invention entitled "Similarity-Based Access Control of Data in a Data Processing
16 System." PersonalWeb has an ownership interest in the '544 patent by assignment, including the
17 exclusive right to enforce the '544 patent within the PersonalWeb Patent Field, and continues to hold
18 that ownership interest in the '544 patent.

19 72. Defendant has infringed at least claims 46, 48, 52, and 55 of the '544 patent by its
20 manufacture, use, sale, importation, and/or offer for sale of products or services, and/or controlling the
21 distribution of its webpage content in the manner described herein. Defendant's infringement is literal
22 and/or under the doctrine of equivalents and Defendant is liable for its infringement of the '544 patent
23 pursuant to 35 U.S.C. § 271.

24 73. For example, claim 46 covers a claimed "computer-implemented method." On
25 information and belief, Defendant uses the claimed computer implemented method by using a system
26 of notifications and authorizations to locate and control the distribution of data items, such as various
27 webpage base files and asset files, necessary to render its webpages.

28

1 74. Claim 46 then recites the act of “(A) for each particular file of a plurality of files:
2 (a2) determining a particular digital key for the particular file, wherein the particular file comprises a
3 first one or more parts.” On information and belief, each of Defendant’s webpages comprises one or
4 more asset files and has an associated webpage base file, the webpage base file containing the URIs
5 having fingerprints of a plurality of asset files comprising the webpage, and once the webpage base
6 files and asset files are compiled and complete, Defendant stores them on a host system. On
7 information and belief, the webpage base file’s associated ETag value is generated by applying a hash
8 algorithm to the webpage base file’s contents. On information and belief, whenever a new webpage
9 base file is generated or the webpage base file’s content changes, Defendant caused an ETag to be
10 determined and associated to the webpage base file.

11 75. Claim 46 then recites “each part of said first one or more parts having a corresponding
12 part value, the part value of each specific part of said first one or more parts being based on a first
13 function of the contents of the specific part, wherein two identical parts will have the same part value
14 as determined by the first function, and wherein the particular digital key for the particular file is
15 determined using a second function of the one or more of part values of said first one or more parts.”
16 On information and belief, prior to various asset files being stored on a host system, a fingerprint is
17 generated for each of these asset files by applying a hash function to the asset file’s contents and the
18 fingerprints are inserted into the URIs for the respective asset files. On information and belief, the
19 webpage’s ETag value is generated by applying a second hash function to the webpage base file’s
20 contents, which include the URIs of one or more of the asset files which comprise the webpage’s
21 contents. On information and belief, because the respective asset files’ URIs include the fingerprints
22 of their content, the webpage’s ETag value will change and a new associated ETag value is generated
23 to represent the webpage’s content, when the content changes and two identical webpages having the
24 identical content represented by their webpage base file will have the same ETag value.

25 76. Claim 46 then recites the act of “(a2) adding the particular digital key of the particular
26 file to a database, the database including a mapping from digital keys of files to information about the
27 corresponding files.” On information and belief, Defendant caused the origin server, intermediate
28 caches and endpoint caches to maintain databases/tables which mapped the ETag of each webpage’s

1 webpage base file to its URI, and information about the corresponding webpage, such as, for example,
2 information from cache-control headers for the webpage.

3 77. Claim 46 then recites “(B) determining a search key based on search criteria, wherein
4 the search criteria comprise a second one or more parts, each of said second one or more parts of said
5 search criteria having a corresponding part value, the part value of each specific part of said second
6 one or more parts being based on the first function of the contents of the specific part, and wherein the
7 search key is determined using the second function of the one or more of part values of said second
8 one or more parts.” On information and belief, when a downstream intermediate cache server or a
9 browser again requested a webpage of Defendant, Defendant caused it to send a conditional GET
10 request with an If-None-Match header with the webpage’s associated ETag value. On information
11 and belief, the received ETag value was determined using the second hash function of the webpage’s
12 webpage base file, which included URIs including fingerprints for one or more of the asset files which
13 comprised the webpage’s contents.

14 78. Claim 46 then recites “(C) attempting to match the search key with a digital key in the
15 database.” On information and belief, when the responding server received the webpage’s ETag value
16 in a conditional GET request with an If-None-Match header, it compared the received ETag with the
17 ETag it has maintained in a database/table corresponding to the URI of the webpage’s webpage base
18 file to determine if there is matching value for that webpage.

19 79. Claim 46 then recites “(D) if the search key matches a particular digital key in the
20 database, providing information about the file corresponding to the particular digital key.” On
21 information and belief, if the responding server had a matching ETag value for the webpage’s webpage
22 base file, the responding server sent an HTTP 304 response, which included information about the
23 corresponding webpage, such as, for example, information from cache-control headers for the
24 webpage.

25 80. Defendant’s acts of infringement have caused damage to PersonalWeb and
26 PersonalWeb is entitled to recover from Defendant the damages sustained by PersonalWeb as a result
27 of Defendant’s wrongful acts in an amount subject to proof at trial.
28

FOURTH CLAIM FOR RELIEF

INFRINGEMENT OF U.S. PATENT NO. 8,099,420

1
2
3 81. PersonalWeb repeats and realleges paragraphs 1–51, as if the same were fully stated
4 herein.

5 82. On January 17, 2012, United States Patent No. 8,099,420 (the “’420 patent”) was duly
6 and legally issued for an invention entitled “Accessing Data in a Data Processing System.”
7 PersonalWeb has an ownership interest in the ’420 patent by assignment, including the exclusive right
8 to enforce the ’420 patent within the PersonalWeb Patent Field, and continues to hold that ownership
9 interest in the ’420 patent.

10 83. Defendant has infringed claims 25, 26, 27, 29, 30, 32, 34–36, and 166 of the ’420 patent
11 by its manufacture, use, sale, importation, and/or offer for sale of products or services, and/or
12 controlling the distribution of its webpage content in the manner recited herein. Defendant’s
13 infringement is literal and/or under the doctrine of equivalents and Defendant is liable for its
14 infringement of the ’420 patent pursuant to 35 U.S.C. § 271.

15 84. For example, claim 166 covers a “system comprising hardware, including at least a
16 processor, and software, in combination with said hardware.” On information and belief, Defendant
17 has controlled the distribution of its website content across a system that included hardware including
18 a processor, such as its production servers as well as origin servers, intermediate cache servers, and
19 endpoint caches; and software, in combination with such hardware, such as a web development
20 framework, software utilized in implementing the HTTP web protocol, and the software used on host
21 servers that Defendant used to serve its webpages.

22 85. Claim 166 then recites “(A) for a particular data item in a set of data items, said
23 particular data item comprising a corresponding particular sequence of bits.” On information and
24 belief, Defendant’s system has controlled the distribution of webpage base files and asset files
25 necessary to render its webpages which represent particular data items, and each of these files comprise
26 a corresponding sequence of bits.

27 86. Claim 166 then recites that for the particular data item to “(a1) determine one or more
28 content-dependent digital identifiers for said particular data item, each said content-dependent digital

1 identifier being based at least in part on a given function of at least some of the bits in the particular
2 sequence of bits of the particular data item, wherein two identical data items will have the same digital
3 identifiers as determined using said given function.” On information and belief, Defendant’s system
4 has applied hash functions to each of various Defendant’s webpage base files to all of the bits of the
5 file’s content to determine a fingerprint, an ETag, or both for the file’s content; whereby two identical
6 data items have the same ETag values and the same fingerprint values. On information and belief,
7 fingerprints were included in files’ URI and ETag values were associated with files’ URIs.

8 87. Claim 166 then recites that for the particular data item “(a2) selectively permits the
9 particular data item to be made available for access and to be provided to or accessed by or from at
10 least some of the computers in a network of computers, wherein the data item is not to be made
11 available for access or provided without authorization, as resolved based, at least in part, on whether
12 or not at least one of said one or more content-dependent digital identifiers for said particular data item
13 corresponds to an entry in one or more databases, each of said one or more databases comprising a
14 plurality of identifiers, each of said identifiers in each said database corresponding to at least one data
15 item of a plurality of data items, and each of said identifiers in each said database being based, at least
16 in part, on at least some of the data in a corresponding data item.”

17 88. On information and belief, Defendant’s system has included one or more web servers
18 with databases containing ETag values associated with the URIs for various of the webpage base files
19 and asset files necessary to render its webpages; moreover, Defendant’s system has used a system of
20 conditional GET requests with If-None-Match headers and HTTP 304 and HTTP 200 responses
21 containing the ETags, as described more particularly *supra*, to ensure that downstream caches only
22 access authorized file content to either serve that file content further downstream or to use it to render
23 Defendant’s webpages. On information and belief, in particular, as more fully described *supra*, the
24 system compared the ETag received in a given conditional GET request with the ETags contained in
25 the database to selectively determine whether the requesting computer could access the file content it
26 already had or must access newly received authorized content.

27
28

1 89. Defendant's acts of infringement have caused damage to PersonalWeb and
2 PersonalWeb is entitled to recover from Defendant the damages sustained by PersonalWeb as a result
3 of Defendant's wrongful acts in an amount subject to proof at trial.

4
5 **PRAYER FOR RELIEF**

6 WHEREFORE, Plaintiff PersonalWeb requests entry of judgment in its favor and against
7 Defendant as follows:

8 a) Declaration that Defendant has infringed U.S. Patent Nos. 6,928,442, 7,802,310,
9 7,945,544, and 8,099,420 as described in this action;

10 b) Awarding the damages arising out of Defendant's infringement of U.S. Patent Nos.
11 6,928,442, 7,802,310, 7,945,544, and 8,099,420, together with pre-judgment and post-judgment
12 interest, in an amount according to proof;

13 c) An award of attorneys' fees pursuant to 35 U.S.C. § 285 or as otherwise permitted by
14 law; and

15 d) For costs incurred and such other and further relief as the Court may deem just and
16 proper.
