

**IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF MASSACHUSETTS**

Bell Semiconductor, LLC

Plaintiff,

v.

Marvell Semiconductor, Inc.,

Defendant.

Civil Action No. 4:22-cv-11906

JURY TRIAL DEMANDED

FIRST AMENDED COMPLAINT

Plaintiff Bell Semiconductor, LLC (“Bell Semic” or “Plaintiff”) brings this Complaint against Defendant Marvell Semiconductor, Inc. (“Marvell”) for infringement of U.S. Patent No. 7,231,626 (“the ’626 patent”). Plaintiff, on personal knowledge of its own acts, and on information and belief as to all others based on investigation, alleges as follows:

SUMMARY OF THE ACTION

1. This is a patent infringement suit relating to Marvell’s unauthorized and unlicensed use of the ’626 patent. The circuit design methodologies claimed in the ’626 patent are used by Marvell in the production of one or more of its semiconductor chips, including its including its 88E1512 Single Chip Ethernet transceiver semiconductor device (“Marvell Accused Product”).
2. Traditionally, the process flow for IC design is highly linear, with each phase of the design process depending on the previous steps. Accordingly, when revisions to portions of the physical design are made, as typically happens numerous times during the design process, all the subsequent steps typically need to be redone in their entirety for at least the layer, if not the entire device. This is because regardless of the size or extent of the revision to the physical design, the

changes must be merged into a much larger integrated circuit design and then the remaining steps of the design process flow re-run.

3. Semiconductor devices include different kinds of materials to function as intended. For example, these devices typically include both metal (*i.e.*, conductor) and insulator materials, which are deposited or otherwise processed sequentially in layers to form the final device. These layers—and the interconnects and components formed within them—have gotten much smaller over time, increasing the performance of these devices dramatically. As a result, it has become even more important to keep the layers planar as the device is being built because defects and warpage can cause fabrication issues and malfunctioning of the device.

4. Manufacturers use a process called Chemical Mechanical Planarization/Polishing (“CMP”) to smooth out the surface of the device to prepare the device for further processing, such as deposition of another layer. This allows subsequent layers to be built and connected more easily with fewer opportunities for short circuits or other errors that render the device defective. CMP functions best when there is a certain density and variance of the same material on the surface of the chip. This is because different materials will be “polished” away at different rates, leading to erosion or dishing on the surface.

5. To reduce this problem “dummy” material, also known as “dummy fill,” is typically inserted into low-density regions of the device to increase the overall uniformity of the structures on the surface of the layer and reduce the density variability across the surface of the device. However, dummy fill can increase capacitance if it is placed too close to signal wires, which slows the transmission speed of signals and degrades the overall performance of the device.

6. Before the inventions claimed in the ’626 patent, the typical turnaround time for implementing a change to the physical design for cutting edge devices was approximately one

week regardless of the size of the change. This is extremely inefficient in most instances where the change relates to only a small fraction of the overall design. *See* Ex. A at 3:16–18 & Fig. 1.

7. The '626 patent's inventors solved this problem by defining a window that encloses a change specified by the revision to physical design. The window defines an area that is less than the area of the entire circuit design. Only the nets within that window are routed pursuant to the revision, leaving the remaining nets in the design unaffected. Then, the results of that incremental routing are inserted into a copy of the original IC design to produce a revised IC design that effects the physical design change without needing to redo the entire process flow.

8. Bell Semic brings this action to put a stop to Marvell's unauthorized and unlicensed use of the inventions claimed in the '626 patent.

THE PARTIES

9. Plaintiff Bell Semic is a limited liability company organized under the laws of the State of Delaware with a place of business at One West Broad Street, Suite 901, Bethlehem, PA 18018.

10. Bell Semic stems from a long pedigree that began at Bell Labs. Bell Labs sprung out of the Bell System as a research and development laboratory, and eventually became known as one of America's greatest technology incubators. Bell Labs employees invented the transistor in 1947 in Murray Hill, New Jersey. It was widely considered one of the most important technological breakthroughs of the time, earning the inventors the Nobel Prize in Physics. Bell Labs made the first commercial transistors at a plant in Allentown, Pennsylvania. For decades, Bell Labs licensed its transistor patents to companies throughout the world, creating a technological boom that led to the use of transistors in the semiconductor devices prevalent in most electronic devices today.

11. Bell Semic, a successor to Bell Labs' pioneering efforts, owns over 1,900 worldwide patents and applications, approximately 1,500 of which are active United States patents. This patent portfolio of semiconductor-related inventions was developed over many years by some of the world's leading semiconductor companies, including Bell Labs, Lucent Technologies, Agere Systems, and LSI Logic and LSI Corporation ("LSI"). This portfolio reflects technology that underlies many important innovations in the development of semiconductors and integrated circuits for high-tech products, including smartphones, computers, wearables, digital signal processors, IoT devices, automobiles, broadband carrier access, switches, network processors, and wireless connectors.

12. The principals of Bell Semic all worked at Bell Labs' Allentown facility, and have continued the rich tradition of innovating, licensing, and helping the industry at large since those early days at Bell Labs. For example, Bell Semic's CTO was a LSI Fellow and Broadcom Fellow. He is known throughout the world as an innovator with more than 300 patents to his name, and he has a sterling reputation for helping semiconductor fabs improve their efficiency. Bell Semic's CEO took a brief hiatus from the semiconductor world to work with Nortel Networks in the telecom industry during its bankruptcy. His efforts saved the pensions of tens of thousands of Nortel retirees and employees. In addition, several Bell Semic executives previously served as engineers at many of these companies and were personally involved in creating the ideas claimed throughout Bell Semic's extensive patent portfolio.

13. On information and belief, Marvell Semiconductor, Inc. has its principal place of business at 5488 Marvell Lane, Santa Clara, CA 95054.

14. On information and belief, Marvell develops, designs, and/or manufactures products in the United States, including in this District, according to the '626 patented

processes/methodologies; and/or uses the '626 patented processes/methodologies in the United States, including in this District, to make products; and/or distributes, markets, sells, or offers to sell in the United States and/or imports products into the United States, including in this District, that were manufactured or otherwise produced using the patented process. Additionally, Marvell introduces those products into the stream of commerce knowing that they will be sold and/or used in this District and elsewhere in the United States.

JURISDICTION AND VENUE

15. This is an action for patent infringement arising under the Patent Laws of the United States, Title 35 of the United States Code. Accordingly, this Court has subject matter jurisdiction under 28 U.S.C. §§ 1331 and 1338(a).

16. This Court has personal jurisdiction over Marvell under the laws of the State of Massachusetts, due at least to its substantial business in Massachusetts and in this District. Marvell has purposefully and voluntarily availed itself of the privileges of conducting business in the United States, in the State of Massachusetts, and in this District by continuously and systematically placing goods into the stream of commerce through an established distribution channel with the expectation that they will be purchased by consumers in this District. In the State of Massachusetts and in this District, Marvell, directly or through intermediaries: (i) performs at least a portion of the infringements alleged herein; (ii) develops, designs, and/or manufactures products according to the '626 patented processes/methodologies; (iii) distributes, markets, sells, or offers to sell products formed according to the '626 patented processes/methodologies; and/or (iv) imports products formed according to the '626 patented processes/methodologies.

17. On information and belief, venue is proper in this Court pursuant to 28 U.S.C. §§

1391 and 1400 because Marvell has committed, and continues to commit, acts of infringement in this District and has a regular and established place of business in this District. For example, Marvell maintains a regular and established place of business at 8 Technology Dr., Westborough, MA 01581. *See Corporate Offices*, (available at <https://www.marvell.com/company/offices.html#usa>) (last visited November 3, 2022) (showing that of Marvell’s 13 United States offices, 1 is located in Massachusetts). Moreover, on information and belief, Marvell employs more than 200 engineers in the state. *See Search Results for Current Marvell Employees*, LinkedIn (available at <https://www.linkedin.com/company/marvell/people/?facetGeoRegion=us%3A7&keywords=engineer>) (last visited November 3, 2022).

18. Currently, on information and belief, Marvell advertises available employment in this District. *See Marvell Careers, Marvell* (available at https://marvell.wd1.myworkdayjobs.com/en-US/MarvellCareers?Country=bc33aa3152ec42d4995f4791a106ed09&State_Region_Province=c66d738416b74fb180376cf59cc7ec8f) (last visited November 3, 2022). These positions include those that relate to the ’626 patented processes/methodologies, such as positions for a Staff Package Engineer, Senior Staff Engineer, and Distinguished Engineer. *Id.*

19. Venue is also convenient in this District. This is at least true because of this District’s close ties to this case—including the technology, relevant witnesses, and sources of proof noted above—and its ability to quickly and efficiently move this case to resolution.

20. On information and belief, Bell Semic’s causes of action arise directly from Marvell’s circuit design work and other activities in this District. Moreover, on information and belief, Marvell has derived substantial revenues from its infringing acts occurring within the State

of Massachusetts and within this District.

U.S. PATENT NO. 7,231,626

21. Bell Semiconductor owns by assignment the entire right, title, and interest in the '626 patent, entitled "Method Of Implementing An Engineering Change Order In An Integrated Circuit Design By Windows."

22. A true and correct copy of the '626 patent is attached as Exhibit A.

23. The '626 patent issued to inventors Jason K. Hoff, Viswanathan Lakshmanan, Michael Josephides, Daniel W. Prevedel, Richard D. Blinne, and Johathan P. Kuppinger.

24. The application that resulted in issuance of the '626 patent, United States Patent Application No. 11/015,123, was filed December 17, 2004. It issued on June 12, 2007 and expires on July 26, 2025.

25. The '626 patent generally relates to "methods of implementing an engineering change order (ECO) in an integrated circuit design." Ex. A at 1:1–13.

26. The background section of the '626 patent identifies the shortcomings of the prior art. More specifically, the specification describes that the prior circuit design methodology was disadvantageous because "[i]n previous methods for implementing an engineering change order (ECO) request in an integrated circuit design, design tools are run for the entire integrated circuit design, even though the engineering change order typically is only a small fraction of the size of the integrated circuit design" Ex. A at 2:15–19.

27. The '626 patent elaborates that because "cell placement, routing, design rule check validation, and timing closure run times typically scale with the size of the entire integrated circuit design," Ex. A at 2:20–22, this produced a "typical turnaround time" of "about one week regardless of the size of the engineering change order. . . . because although the engineering

change order may only have a size of a few cells, it must be merged with an integrated circuit design that typically has a much greater size.” *Id.* at 2:37–44. Certain of these steps “may be especially time consuming and resource intensive.” *Id.* at 3:16–17.

28. The inventions disclosed in the ’626 patent provide many advantages over the prior art. In particular, they provide a simple and efficient method for ensuring that revisions to the physical design of the IC do not unduly delay the completion of the design process. As the ’626 patent explains, “significant savings in the resources required to perform routing, design rule check verification, net delay calculation, and parasitic extraction may be realized by creating windows in the integrated circuit design that include only the incremental changes to the overall integrated circuit design.” Ex. A at 3:19–23.

29. As mentioned above, this is very beneficial because it substantially reduces the run time of the routing tools and related follow-on steps of the layout portion of the design process flow (such as calculation of net delay, design rule check, and parasitic extraction). Thus, it shortens the overall design timeline, and avoids cost overruns and delays, making it less costly to make changes later in the design process or more often. *See id.*

30. Given the aforementioned increased complexity of circuit designs and the corresponding delays from design changes, these efficiency gains have become more and more important in completing the design process without affecting time-to-market. These significant advantages are achieved through the use of the patented inventions and thus the ’626 patent presents significant commercial value for chip designers.

31. In light of the drawbacks of the prior art, the ’626 patent’s inventors recognized the need for a circuit design methodology in which the time required to implement an ECO “depend[s] on the number of net changes in the [ECO] rather than on the total number of nets in

the entire integrated circuit design.” Ex. A at 2:51–53. The inventions claimed in the ’626 patent address this need.

32. The ’626 patent contains two independent claims and 8 total claims, covering a method and computer readable medium for implementing a change order in an integrated circuit design. Claim 1 reads:

1. A method comprising steps of:
 - (a) receiving as input an integrated circuit design;
 - (b) receiving as input an engineering change order to the integrated circuit design;
 - (c) creating at least one window in the integrated circuit design that encloses a change to the integrated circuit design introduced by the engineering change order wherein the window is bounded by coordinates that define an area that is less than an entire area of the integrated circuit design;
 - (d) performing an incremental routing of the integrated circuit design only for each net in the integrated circuit design that is enclosed by the window;
 - (e) replacing an area in a copy of the integrated circuit design that is bounded by the coordinates of the window with results of the incremental routing to generate a revised integrated circuit design; and
 - (f) generating as output the revised integrated circuit design.

33. This claim, as a whole, provides significant benefits and improvements to the function of the semiconductor device design process, *e.g.*, providing a novel and substantially more efficient process flow in which only the affected nets would be considered in the incremental routing. This results in substantial reduction in the expected time of the design portion of producing semiconductor devices.

34. The claims of the ’626 patent also recite inventive concepts that improve the functioning of the fabrication process, particularly as to post-ECO routing. The claims of the ’626 patent disclose a new and novel solution to specific problems related to improving semiconductor

fabrication. As explained in detail above and in the '626 patent specification, the claimed inventions improve upon the prior art processes by ignoring nets that are unaffected by an ECO in performing routing following the ECO. This has the advantage of substantially reducing the impact on design schedule of ECOs and other layout changes, thus increasing the efficiency of the design process and making it easier to improve the design and fix design errors without unduly delaying time-to-market. By making it easier to fix errors as they are found, and causing substantially less incremental delay upon finding and fixing errors, the claimed inventive processes also increase the performance and reliability of the finished product. Because of the claimed inventive processes, individual less impactful design issues that still impact design performance (albeit not on a critical scale) can be caught and fixed without costing the same delay as more substantial errors.

COUNT I – INFRINGEMENT OF U.S. PATENT NO. 7,231,626

35. Bell Semic re-alleges and incorporates by reference the allegations of the foregoing paragraphs as if fully set forth herein.

36. The '626 patent is valid and enforceable under the United States Patent Laws.

37. Bell Semic owns, by assignment, all right, title, and interest in and to the '626 patent, including the right to collect for past damages.

38. A copy of the '626 patent is attached at Exhibit A.

39. On information and belief, Marvell has and continues to directly infringe pursuant to 35 U.S.C. § 271(a) one or more claims of the '626 patent by using the patented methodology to design one or more semiconductor devices, including as one example the Marvell Accused Product, in the United States.

40. On information and belief, Marvell employs a variety of design tools, for example,

Cadence, Synopsys, and/or Siemens tools, to perform incremental routing in implementing an ECO (the “Accused Processes”) as recited in the ’626 patent claims. As one example, Marvell’s Accused Processes perform a method for only routing the nets affected by the ECO and merging that changed area into the overall circuit layout as required by claim 1 of the ’626 patent. Marvell does so by employing a design tool, such as at least one of a Cadence, Synopsys, and/or Siemens tool, to perform incremental routing as part of implementing an ECO for the Marvell Accused Product to generate a revised integrated circuit design.

41. Marvell’s Accused Processes also calculate and perform a parasitic extraction only for each net in the IC design enclosed by the window defining the ECO (This parasitic extraction is also how the Accused Processes further calculate a net delay only for each net in the IC design enclosed by the window defining the ECO). Marvell does so by employing a design tool, such as at least one of the Cadence, Synopsys, and/or Siemens tools, to perform the incremental routing during implementation of the ECO for the Marvell Accused Product’s circuit designs.

42. Marvell’s Accused Processes also perform a design rule check only for each net in the IC design enclosed by the ECO window. Marvell does so by employing a design tool, such as at least one of the Cadence, Synopsys, and/or Siemens tools, perform the incremental ECO and automatically perform a DRC for those nets to ensure that the ECO did not violate any design rules when it fixed other issues.

43. An exemplary infringement analysis showing infringement of one or more claims of the ’626 patent is set forth in Exhibit B. The declaration of Lloyd Linder, an expert in the field of semiconductor device design, is attached at Exhibit C and further describes Marvell’s infringement of the ’626 patent.

44. Marvell’s Accused Processes infringe and continue to infringe one or more claims

of the '626 patent during the pendency of the '626 patent.

45. On information and belief, Marvell has and continues to infringe directly pursuant to 35 U.S.C. § 271, *et. seq.*, either literally or under the doctrine of equivalents, by using the Accused Processes in violation of one or more claims of the '626 patent. Marvell has and continues to infringe pursuant to 35 U.S.C. § 271, *et. seq.*, either literally or under the doctrine of equivalents, by making, selling, or offering to sell in the United States, or importing into the United States products manufactured or otherwise produced using the Accused Processes in violation of one or more claims of the '626 patent.

46. Marvell's infringement of the '626 patent is exceptional and entitles Bell Semic to attorneys' fees and costs incurred in prosecuting this action under 35 U.S.C. § 285.

47. Bell Semic has been damaged by Marvell's infringement of the '626 patent and will continue to be damaged unless Marvell is enjoined by this Court. Bell Semic has suffered and continues to suffer irreparable injury for which there is no adequate remedy at law. The balance of hardships favors Bell Semic, and public interest is not disserved by an injunction.

48. Bell Semic is entitled to recover from Marvell all damages that Bell Semic has sustained as a result of Marvell's infringement of the '626 patent, including without limitation and/or not less than a reasonable royalty.

PRAYER FOR RELIEF

WHEREFORE, Bell Semic respectfully requests that this Court enter judgment in its favor as follows and award Bell Semic the following relief:

- (a) a judgment declaring that Marvell has infringed one or more claims of the '626 patent in this litigation pursuant to 35 U.S.C. § 271, *et seq.*;
- (b) an award of damages adequate to compensate Bell Semic for infringement of the '626 patent by Marvell, in an amount to be proven at trial, including supplemental post-verdict damages until such time as Marvell ceases its infringing conduct;

- (c) a permanent injunction, pursuant to 35 U.S.C. § 283, prohibiting Marvell and its officers, directors, employees, agents, consultants, contractors, suppliers, distributors, all affiliated entities, and all others acting in privity with Marvell from committing further acts of infringement, with respect to the '626 patent;
- (d) a judgment requiring Marvell to make an accounting of damages resulting from Marvell's infringement of the '626 patent;
- (e) the costs of this action, as well as attorneys' fees as provided by 35 U.S.C. § 285;
- (f) pre-judgment and post-judgment interest at the maximum amount permitted by law;
- (g) all other relief, in law or equity, to which Bell Semic is entitled.

DEMAND FOR JURY TRIAL

Plaintiff hereby demands a jury trial for all issues so triable.
