III. JURISDICTION AND VENUE

4. This action arises under the patent laws of the United States, Title 35 of the United States Code. This Court has subject matter jurisdiction of such action under 28 U.S.C. §§ 1331 and 1338(a).

8 5. On information and belief, Defendant is subject to this Court's specific and general personal jurisdiction, pursuant to due process and the Washington Long-Arm Statute, 10 due at least to its business in this forum, including at least a portion of the infringements alleged herein. Furthermore, Defendant is subject to this Court's specific and general personal 12 jurisdiction because Defendant maintains its principal place of business in Washington and is a 13 Washington corporation.

6. Without limitation, on information and belief, within this State and this District, 15 16 Defendant has used the patented inventions thereby committing, and continuing to commit, acts 17 of patent infringement alleged herein. In addition, on information and belief, Defendant has 18 derived revenues from its infringing acts occurring within Washington and the Eastern District 19 of Washington. Further, on information and belief, Defendant is subject to the Court's general 20 jurisdiction, including from regularly doing or soliciting business, engaging in other persistent 21 courses of conduct, and deriving substantial revenue from goods and services provided to persons 22 23 or entities in Washington and the Eastern District of Washington. Further, on information and 24 belief, Defendant is subject to the Court's personal jurisdiction at least due to its sale of products 25 and/or services within Washington and the Eastern District of Washington. Defendant has 26 committed such purposeful acts and/or transactions in Washington and the Eastern District of 27

22-cv-0300 28 COMPLAINT - 2

Washington such that it reasonably should know and expect that it could be haled into this Court as a consequence of such activity.

- 3 7. Venue is proper in this district under 28 U.S.C. § 1400(b). On information and 4 belief, Defendant is a Washington corporation and maintains its principal place of business within 5 this District. On information and belief, from and within this District Defendant has committed 6 at least a portion of the infringements at issue in this case. 7
- 8 8. For these reasons, personal jurisdiction exists and venue is proper in this Court under 28 U.S.C. § 1400(b).

IV. COUNT I (PATENT INFRINGEMENT OF UNITED STATES PATENT NO. 7,154,961)

10

9

1

2

- 11
- 12

16

9.

Plaintiff incorporates the above paragraphs herein by reference.

13 10. On December 26, 2006, United States Patent No. 7,154,961 ("the '961 Patent") 14 was duly and legally issued by the United States Patent and Trademark Office. The application 15 leading to the '961 Patent was filed on December 6, 2004 (Ex. A at cover).

- 11. The '961 Patent is titled "Constellation Rearrangement for ARQ Transmit 17 Diversity Schemes." A true and correct copy of the '961 Patent is attached hereto as Exhibit A 18 and incorporated herein by reference. 19
- 20 12. Plaintiff is the assignee of all right, title, and interest in the '961 patent, including 21 all rights to enforce and prosecute actions for infringement and to collect damages for all relevant 22 times against infringers of the '961 Patent. Accordingly, Plaintiff possesses the exclusive right 23 and standing to prosecute the present action for infringement of the '961 Patent by Defendant. 24
- 13. The invention in the '961 Patent relates to the field of Automatic Repeat reQuest 25 ("ARQ") transmission techniques in wireless communication systems. (Ex. A at col. 1:6-8). In 26 27 particular, it relates to a method for transmitting data using transmit diversity schemes in which 22-cv-0300 28 COMPLAINT - 3

data packets are transmitted using a first and second transmission based on a repeat request and the bit-to-symbol mapping is performed differently for different transmitted diversity branches. (*Id.* at col. 1:8-12). The inventors recognized a problem in prior art of the use of ARQ transmission techniques in wireless communication systems with unreliable and time-varying channel conditions and the invention results in an improved performance avoiding transmission errors. (*Id.* at col. 1:12-15).

8 14. In telecommunications, in order to improve the reliability of data transmissions, 9 the prior art had several transmit diversity techniques in which redundant versions of identical 10 data are transmitted in at least two diversity branches by default without explicitly requesting 11 further diversity branches. (Id. at col. 1:19-24). Such transmit diversity techniques included (i) 12 site diversity (transmitted signal originates from different sites), (ii) antenna diversity 13 (transmitted signal originates from different antennas), (iii) polarization diversity (transmitted 14 signal is mapped onto different polarization), (iv) frequency diversity (transmitted signal is 15 16 mapped on different carrier frequencies or frequency hopping sequences), (v) time diversity 17 (transmitted signal is mapped on different interleaving sequences), and (vi) multicode diversity 18 (transmitted signal is mapped on different codes). (Id. at col. 1:24-42). The diversity branches 19 would then be combined in order to improve the reliability of the received data. These diversity 20 combining techniques included (a) selection combining (selecting the diversity branch with the 21 highest Signal-to-Noise Ratio ("SNR") for decoding and ignoring the remaining ones), (b) equal 22 23 gain combining (combining received diversity branches with ignoring the differences in received 24 SNR), and (c) maximum ratio combining (combining received diversity branches taking the 25 received SNR of each diversity branch into account).

26

1

2

3

4

5

6

7

- 20
- 27

The prior art also had techniques for error detection/correction with respect to the

28 22-cv-0300 COMPLAINT - 4

15.

MANN LAW GROUP PLLC 403 Madison Ave. N. Ste. 240 Bainbridge Island,, WA 98110 TELEPHONE: 206.436-0900 transmission of data. For example, the prior art would use ARO schemes together with Forward Error Correction (FEC),¹ which is called hybrid ARQ ("HARQ"). If an error is detected within a packet by the Cyclic Redundancy Check ("CRC"), the receiver requests that the transmitter send additional information (e.g., retransmission) to improve the probability to correctly decode the erroneous packet. (Id. at col. 1: 59-63).

16. The '961 discussed a particular prior art reference that had the shortcomings of 7 8 the prior art. WO-02/067491 A1 disclosed a method for HARQ transmission that averages the 9 bit reliability over successively requested retransmissions by means of signal constellation 10 rearrangement. (Id. at col. 1: 64-67). The reference showed that when more than 2 bits of data 11 were mapped onto one modulation symbol, the bits have different reliability depending on the 12 chosen mapping. (Id. at col. 2: 1-5). For most FEC schemes, this leads to a degraded decoder 13 performance compared to an input of more equally distributed bit reliabilities. (Id. at col. 2:5-7). 14 As a result, in conventional communications systems the modulation dependent variations in bit 15 16 reliabilities are not considered and, therefore, usually the variations remain after combining the 17 diversity branches at the receiver. (Id. at col. 2:8-11).

18 17. The inventors therefore developed a method that improved performance with 19 regard to transmission errors. (Id. at col. 2:15-18). The idea of the invention is to improve 20 performance at the receiver by applying different signal constellation mappings to the available 21 distinguishable transmit diversity branches and ARQ retransmissions. (Id. at col. 2:20-23). The 22 23 invention is applicable to modulation formats in which more than 2 bits are mapped onto one

24

3

4

5

6

COMPLAINT - 5

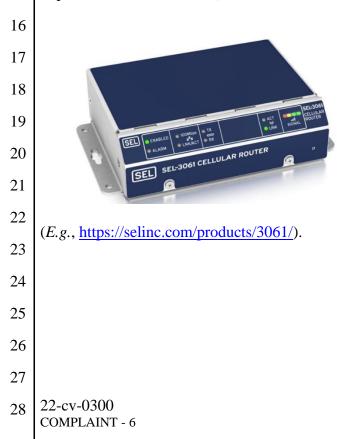

²⁵ FEC is a technique used for controlling errors in data transmission over unreliable or noisy communication channels. The general idea of FED is that a sender encodes the message 26 in a redundant way, most often using an error correction code. The redundancy allows the receiver to detect a limited number of errors that may occur anywhere in the message, and to 27 potentially correct these errors without re-transmission.

²²⁻cv-0300 28

modulation symbol, since this implies a variation in reliabilities for the bits mapped onto the signal constellation. (*Id.* at col. 2:23-29).

18. **Direct Infringement.** Upon information and belief, Defendant has been directly infringing at least claim 1 of the '961 patent in Washington, and elsewhere in the United States, by performing actions comprising at least performing the claimed ARQ re-transmission method by performing the steps of the claimed invention using the Schweitzer Engineering Laboratories SEL-3061 ("Accused Instrumentality") (*e.g.*, https://selinc.com/products/3061/).

19. The Accused Instrumentality practices an ARQ re-transmission (*e.g.*, HARQ method) method in a wireless communication system (*e.g.*, LTE network) wherein data packets are transmitted from a transmitter (*e.g.*, the Accused Instrumentality) to a receiver (*e.g.*, LTE base station) using a first transmission (*e.g.*, HARQ transmission) and at least a second transmission (*e.g.*, HARQ retransmission) based on a repeat request (*e.g.*, HARQ retransmission request in the form of NAK).

SEL-3061

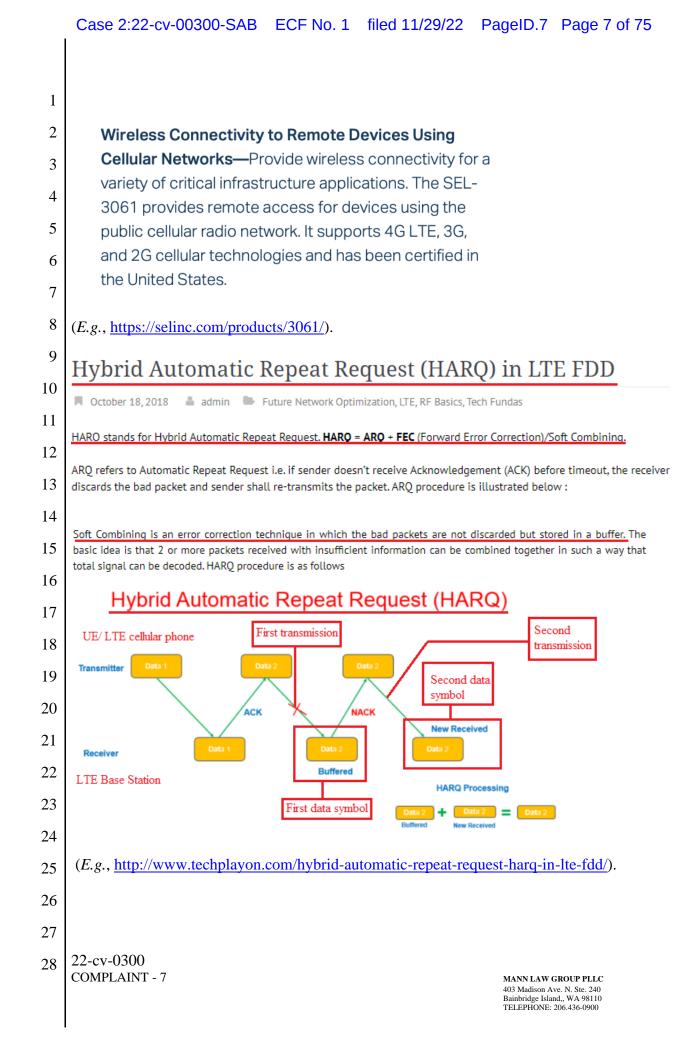

Cellular Router

The SEL-3061 Cellular Router is a secure wireless communications solution designed for critical applications. For electric utilities, the router provides connectivity to devices like recloser controls, motor-operated switches, capacitor banks, voltage regulators, substations, and much more. The combination of serial and Ethernet ports provides application flexibility, and using public networks with secure tunneling makes installation easy without sacrificing security.

1	6.1 Uplink model Data packets transmitted from a transmitter i.e. UE/ LTE cellular phone
2	6.1.1 Uplink Shared Channel
3	The physical-layer model for Uplink Shared Channel transmission is described based on the corresponding physical-
4	layer-processing chain, see Figure 6.1.1. Processing steps that are relevant for the physical-layer model, e.g. in the sense that they are configurable by higher layers, are highlighted in blue. It should be noted that, in case PUSCH, the scheduling decision is partly made at the network side, if there is no blind decoding it is fully done at the network side.
5	The uplink transmission control in the UE then configures the uplink physical-layer processing, based on uplink transport-format and resource-assignment information received on the downlink.
6	- Higher-layer data passed to/from the physical layer
7	 One transport block of dynamic size delivered to the physical layer once every TTI.
8	- CRC and transport-block-error indication
	- Transport-block-error indication delivered to higher layers.
9	- FEC and rate matching
10	 Channel coding rate is implicitly given by the combination of transport block size, modulation scheme and resource assignment;
11	ARQ re-transmission method Physical layer model support of HARQ: in case of Incremental Redundancy, the corresponding Layer 2 Hybrid-
12	ARQ process controls what redundancy version is to be used for the physical layer transmission for each TTI.
	- Interleaving
13	- No control of interleaving by higher layers.
14	- Data modulation
15	- Modulation scheme is decided by MAC Scheduler (QPSK, 16QAM and 64QAM).
16	- Mapping to physical resource
17	- L2-controlled resource assignment.
17	- Multi-antenna processing
18	- MAC Scheduler partly configures mapping from assigned resource blocks to the available number of antenna ports.
19	- Support of L1 control signalling Second transmission i.e. re- transmission based on a repeat
20	- Transmission of ACK/NAK and CQI feedback related to DL data transmission request i.e. NAK
	The model of Figure 6.1.1 also captures
21	- Transport via physical layer of Hybrid-ARQ related information (exact info is FFS) associated with the PUSCH, to the peer HARQ process at the receiver side;
22	- Transport via physical layer of corresponding HARQ acknowledgements to PUSCH transmitter side.

3 Hybrid Automatic Repeat Request (HARQ) in LTE FDD 4 October 18, 2018 👗 admin 🛛 🖿 Future Network Optimization, LTE, RF Basics, Tech Fundas 5 HARO stands for Hybrid Automatic Repeat Request. HARO = ARO + FEC (Forward Error Correction)/Soft Combining. 6 ARQ refers to Automatic Repeat Request i.e. if sender doesn't receive Acknowledgement (ACK) before timeout, the receiver 7 discards the bad packet and sender shall re-transmits the packet. ARO procedure is illustrated below : 8 Soft Combining is an error correction technique in which the bad packets are not discarded but stored in a buffer. The 9 basic idea is that 2 or more packets received with insufficient information can be combined together in such a way that total signal can be decoded. HARQ procedure is as follows 10 Hybrid Automatic Repeat Request (HARQ) 11 Second First transmission 12 UE/ LTE cellular phone transmission 13 Transmitter Second data symbol 14 ACK NACK New Received 15 Receiver 16 Buffered LTE Base Station HARQ Processing 17 First data symbol New Received 18 19 (*E.g.*, http://www.techplayon.com/hybrid-automatic-repeat-request-harg-in-lte-fdd/). 20 21 22 23 24 25 26 27 22-cv-0300 28 COMPLAINT - 13 MANN LAW GROUP PLLC

5.2 Overview of L1 functions

1

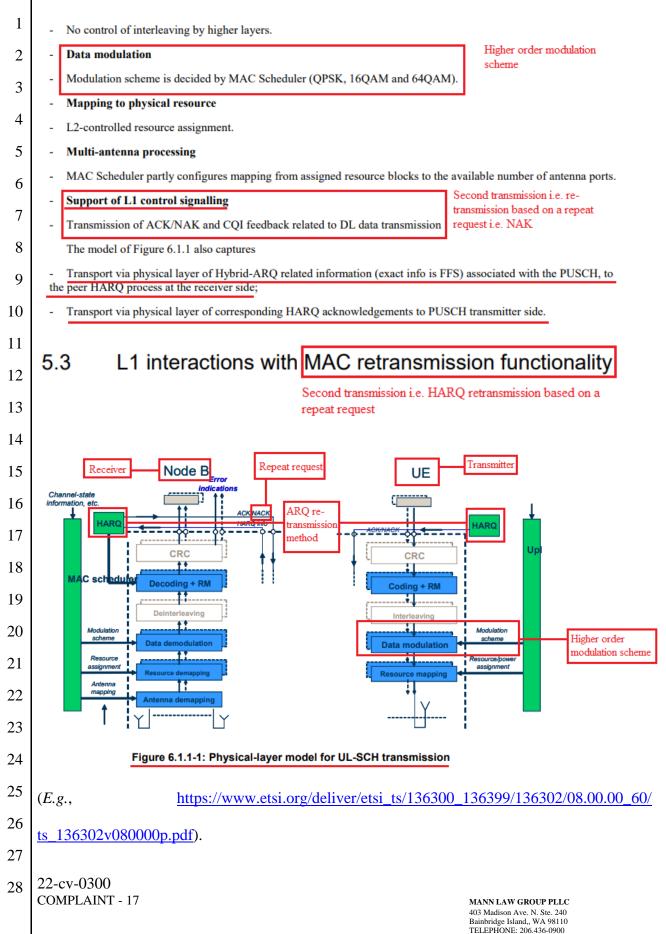

2 The physical layer offers data transport services to higher layers. The access to these services is through the use of a transport channel via the MAC sub-layer. The physical layer is expected to perform the following functions in order to 3 provide the data transport service: - Error detection on the transport channel and indication to higher layers 4 FEC encoding/decoding of the transport channel 5 Hybrid ARQ soft-combining 6 Rate matching of the coded transport channel to physical channels 7 Mapping of the coded transport channel onto physical channels Power weighting of physical channels 8 Modulation and demodulation of physical channels 9 Frequency and time synchronisation 10 Radio characteristics measurements and indication to higher layers 11 Multiple Input Multiple Output (MIMO) antenna processing Transmit Diversity (TX diversity) 12 Beamforming 13 RF processing. (Note: RF processing aspects are specified in the TS 36.100) 14 L1 functions are modelled for each transport channel in subclauses 6.1 and 6.2. 15 https://www.etsi.org/deliver/etsi_ts/136300_136399/136302/08.00.00_60/ (E.g., 16 ts_136302v080000p.pdf). 17 22. Upon information and belief, the Accused Instrumentality practices modulating 18 said data packets at the transmitter (e.g., the Accused Instrumentality) using a second modulation 19 20 scheme (e.g., one of QPSK, 16QAM and 64 QAM)—which is distinct from the first modulation 21 scheme) to obtain second data symbols (e.g., output of modulation block using a second 22 modulation scheme). As shown below, the Accused Instrumentality on repeat request *i.e.*, 23 receiving the retransmission request in the form of NAK, enables a second mapping of said higher 24 order modulation scheme (i.e., an Adaptive Re-transmission having a different Modulation 25 Coding Scheme (MCS) than the one used for HARQ transmission *i.e.*, first higher order 26 27 modulation scheme). 22-cv-0300 28 COMPLAINT - 15 MANN LAW GROUP PLLC

_0	COMPLAINT -	35					MANN LAW GROUP PLLC	
							403 Madison Ave. N. Ste. 240 Bainbridge Island WA 98110	

29. The '961 Patent is titled "Constellation Rearrangement for ARQ Transmit Diversity Schemes." The '622 Patent issued from an application that is a continuation of the application leading to the '961 Patent. A true and correct copy of the '622 Patent is attached hereto as Exhibit B and incorporated herein by reference.

30. Plaintiff is the assignee of all right, title, and interest in the '622 patent, including all rights to enforce and prosecute actions for infringement and to collect damages for all relevant times against infringers of the '622 Patent. Accordingly, Plaintiff possesses the exclusive right and standing to prosecute the present action for infringement of the '622 Patent by Defendant.

31. The '622 patent shares the same specification as the '961 patent and therefore the
background information regarding the '961 patent in paragraphs 11 through 15 are incorporated
by reference.

32. During the prosecution history, applicant explained the benefits of the claimed 14 invention. The claim "defines an ARQ retransmission method in which more than two data bits 15 16 are mapped onto one data symbol in each of the initial transmission and a retransmission. The 17 symbols of the initial transmission and the retransmission represent the same bit information, but 18 are different symbols due to different bit mappings. Since different bits of a modulation symbol 19 have different communications reliabilities, the claimed subject matter supports averaging the 20 communication reliabilities for each bit mapped onto a transmission symbol and a retransmission 21 symbol so as to improve the likelihood of receiving the bit." (Ex. C at 16). 22

23 24 25

26

27

1

2

3

4

5

6

7

8

9

33. An advantage of the claimed subject matter "lies in reducing the overall data traffic, since the claimed retransmission is only needed in situations where any initial transmission cannot be successfully received by a receiver. The claimed subject matter employs retransmission and diversity combining only when the initial transmission is not received

28 22-cv-0300 COMPLAINT - 36 properly, whereas [the prior art] communications scheme always transmits identical data over three parallel paths for diversity combining by a receiver and does not retransmit data in accordance with a repeat request by a receiver." (Ex. C at 17).

34. <u>**Direct Infringement.**</u> Upon information and belief, Defendant has been directly infringing at least claim 1 of the '622 patent in Washington, and elsewhere in the United States, by performing actions comprising at least performing the claimed ARQ re-transmission method by performing the steps of the claimed invention using the Schweitzer Engineering Laboratories SEL-3061 ("Accused Instrumentality") (*e.g.*, <u>https://selinc.com/products/3061/</u>).

10 35. In at least testing and usage, the Accused Instrumentality practices an ARQ re-11 transmission method (e.g., HARQ method) in a wireless communication system (e.g., LTE 12 network) wherein data packets are transmitted from a transmitter (e.g., the Accused 13 Instrumentality) to a receiver (e.g., LTE base station) using a higher order modulation scheme 14 (e.g., one of QPSK,16QAM and 64 QAM) wherein more than two data bits are mapped onto one 15 16 data symbol to perform a first transmission and at least a second transmission (e.g., HARQ 17 retransmission) based on a repeat request (e.g., HARQ retransmission request in the form of 18 NAK). The Accused Instrumentality performs a higher order data modulation such as 16QAM 19 and 64 QAM wherein has more than two data bits are mapped onto one data symbol (*i.e.*, in case 20 of 16QAM it transmits 4 bits per symbol whereas in the case of 64QAM it transmits 6 bits per 21 symbol. 22 23

Overview of L1 functions

The physical layer offers data transport services to higher layers. The access to these services is through the use of a transport channel via the MAC sub-layer. The physical layer is expected to perform the following functions in order to provide the data transport service:

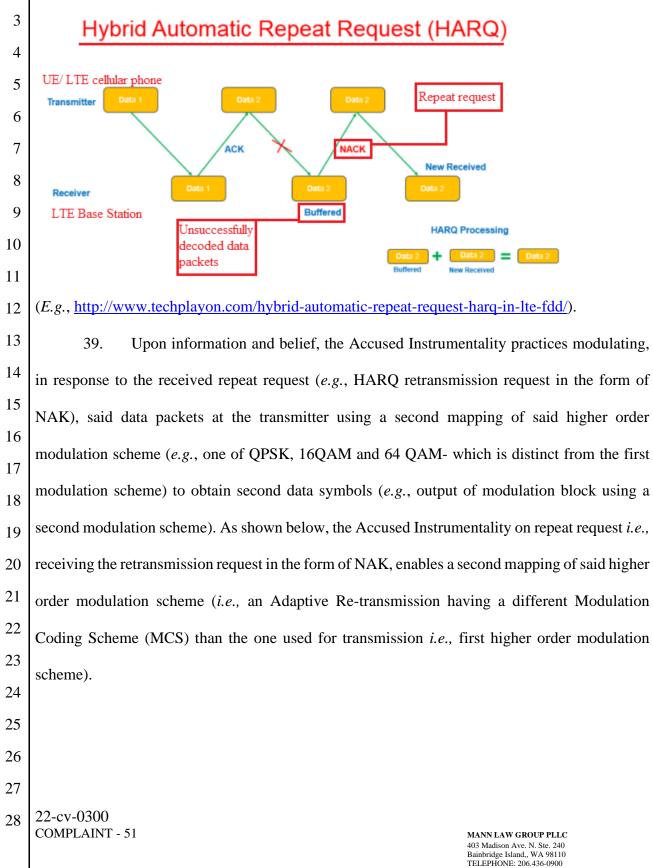

4	- Error detection on the transport channel and indication to higher layers
5	- FEC encoding/decoding of the transport channel
6	- Hybrid ARQ soft-combining
7	- Rate matching of the coded transport channel to physical channels
	 Mapping of the coded transport channel onto physical channels
8	- Power weighting of physical channels
9	- Modulation and demodulation of physical channels
10	- Frequency and time synchronisation
11	- Radio characteristics measurements and indication to higher layers
	- Multiple Input Multiple Output (MIMO) antenna processing
12	- Transmit Diversity (TX diversity)
13	- Beamforming
14	- RF processing. (Note: RF processing aspects are specified in the TS 36.100)
15	L1 functions are modelled for each transport channel in subclauses 6.1 and 6.2.
16	(<i>E.g.</i> , <u>https://www.etsi.org/deliver/etsi_ts/136300_136399/136302/08.00.00_60/</u>
17	<u>ts_136302v080000p.pdf</u>).
18	38. Upon information and belief, the Accused Instrumentality practices performing
19	
20	receiving at the transmitter (e.g., the Accused Instrumentality) the repeat request (e.g., HARQ
21	retransmission request in the form of NAK) issued by the receiver (e.g., LTE base station) to
22	retransmit the data packets in case the data packets of the first transmission have not been
23	successfully decoded (<i>e.g.</i> , Error indication in the data received).
24	
25	

2

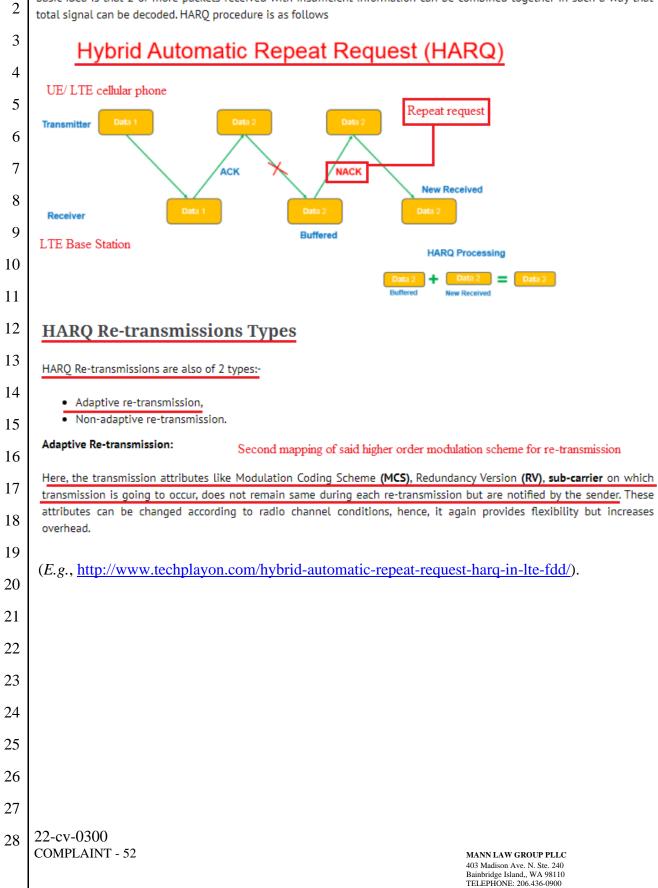

Soft Combining is an error correction technique in which the bad packets are not discarded but stored in a buffer. The basic idea is that 2 or more packets received with insufficient information can be combined together in such a way that total signal can be decoded. HARQ procedure is as follows

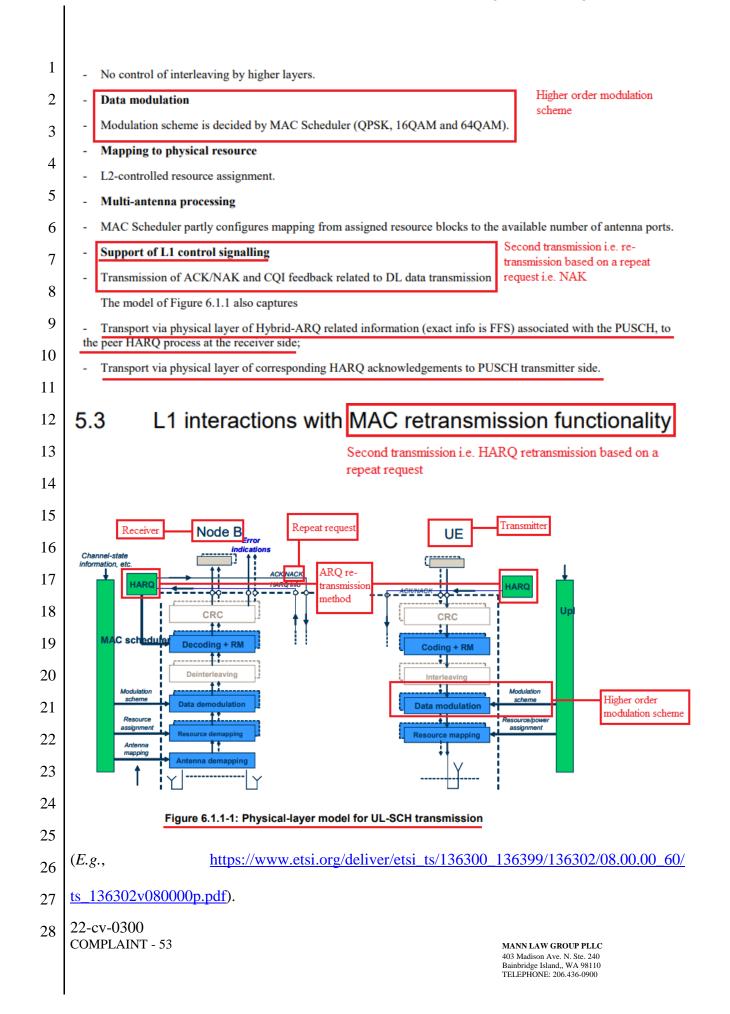

Case 2:22-cv-00300-SAB ECF No. 1 filed 11/29/22 PageID.52 Page 52 of 75

1	specific reference signals within the considered measurement frequency bandwidth. For RSRP determination the cell-
2	specific reference signals R ₀ and if available R ₁ according to [8] can be used. If receiver diversity is in use by the UE, the reported value shall be equivalent to the linear average of the power values
3	of all diversity branches.
4	
5	5.3 L1 interactions with MAC retransmission functionality
6	Second transmission i.e. HARQ retransmission based on a repeat request
7	repear request
8	5.2 Overview of L1 functions
9	The physical layer offers data transport services to higher layers. The access to these services is through the use of a transport channel via the MAC sub-layer. The physical layer is expected to perform the following functions in order to provide the data transport service:
10	 Error detection on the transport channel and indication to higher layers
11	- FEC encoding/decoding of the transport channel
12	- Hybrid ARQ soft-combining Diversity combining
13	- Rate matching of the coded transport channel to physical channels
14	- Mapping of the coded transport channel onto physical channels
15	- Power weighting of physical channels
	- Modulation and demodulation of physical channels
16	- Frequency and time synchronisation
17	- Radio characteristics measurements and indication to higher layers
18	- Multiple Input Multiple Output (MIMO) antenna processing
19	- Transmit Diversity (TX diversity)
20	- Beamforming
	 RF processing. (Note: RF processing aspects are specified in the TS 36.100)
21	L1 functions are modelled for each transport channel in subclauses 6.1 and 6.2.

1

2

3

Soft Combining is an error correction technique in which the bad packets are not discarded but stored in a buffer. The basic idea is that 2 or more packets received with insufficient information can be combined together in such a way that total signal can be decoded. HARQ procedure is as follows

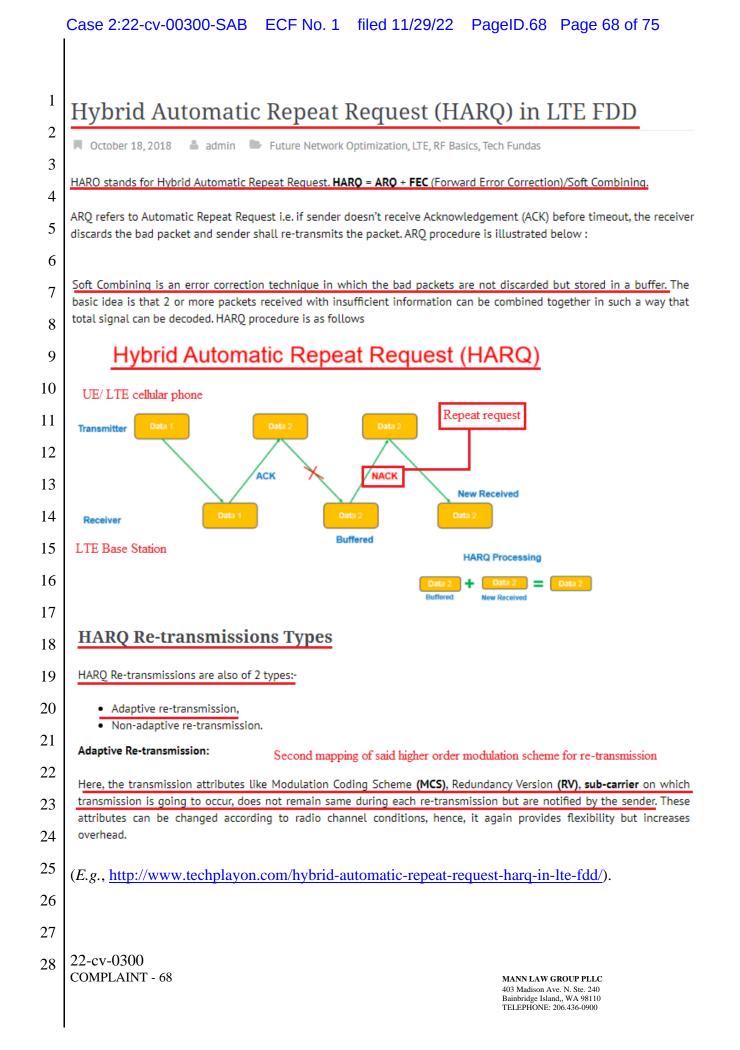

Hybrid Automatic Repeat Request (HARQ)

12 (E.g., <u>http://www.techplayon.com/hybrid-automatic-repeat-request-harq-in-lte-fdd/</u>).

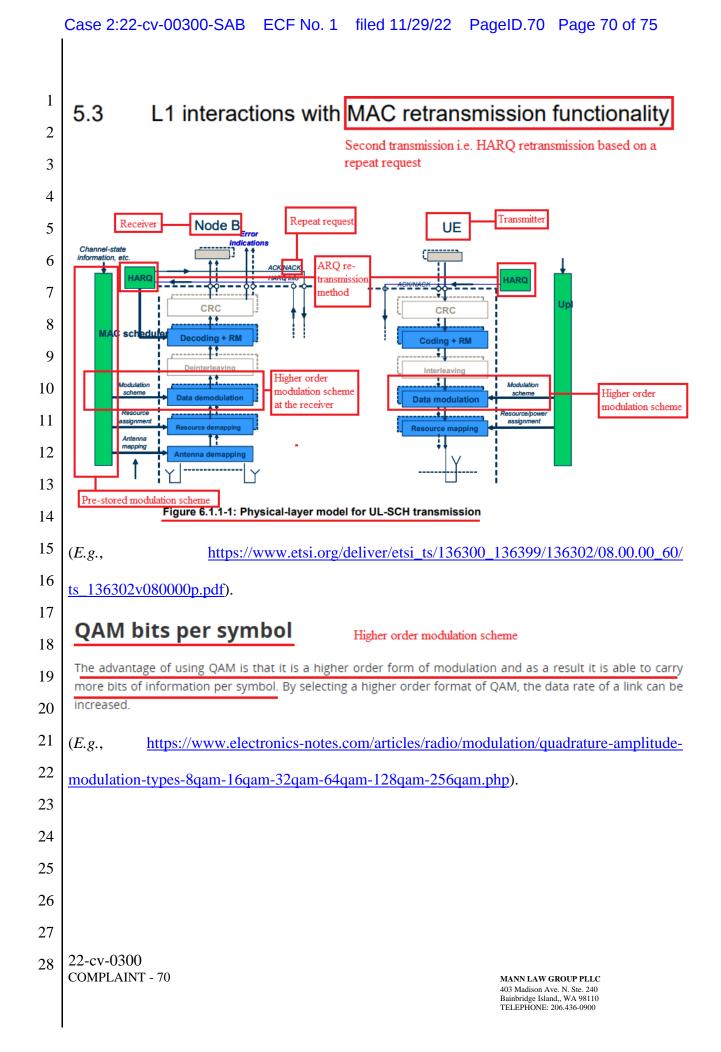

13 43. The Accused Instrumentality, at least in its internal testing and usage, utilizes a 14 base station receiver wherein the first and second mapping of said higher order modulation 15 schemes are pre-stored in a memory table (e.g., modulation schemes are decided by MAC 16 Scheduler). The Accused Instrumentality performs a first higher order data modulation such as 17 16QAM and 64 QAM wherein has more than two data bits are mapped onto one data symbol 18 (*i.e.*, in case of 16QAM it transmits 4 bits per symbol whereas in the case of 64QAM it transmits 19 20 6 bits per symbol). The Accused Instrumentality on repeat request *i.e.*, receiving the 21 retransmission request in the form of NAK, enables a second mapping of said higher order 22 modulation scheme (*i.e.*, an Adaptive Re-transmission having a different Modulation Coding 23 Scheme (MCS) than the one used for transmission *i.e.*, first higher order modulation scheme). 24 25

27
28 22-cv-0300 COMPLAINT - 67

1	6.1 Uplink model Data packets transmitted from a transmitter i.e. UE/LTE cellular phone
2	6.1.1 Uplink Shared Channel
3	The physical-layer model for Uplink Shared Channel transmission is described based on the corresponding physical-
4	layer-processing chain, see Figure 6.1.1. Processing steps that are relevant for the physical-layer model, e.g. in the sense that they are configurable by higher layers, are highlighted in blue. It should be noted that, in case PUSCH, the
5	scheduling decision is partly made at the network side, if there is no blind decoding it is fully done at the network side. The uplink transmission control in the UE then configures the uplink physical-layer processing, based on uplink transport-format and resource-assignment information received on the downlink.
6	- Higher-layer data passed to/from the physical layer
7	- One transport block of dynamic size delivered to the physical layer once every TTI.
8	- CRC and transport-block-error indication
9	- Transport-block-error indication delivered to higher layers.
10	- FEC and rate matching
10	- Channel coding rate is implicitly given by the combination of transport block size, modulation scheme and resource
11	assignment; ARQ re-transmission method
12	 Physical layer model support of HARQ: in case of Incremental Redundancy, the corresponding Layer 2 Hybrid- ARQ process controls what redundancy version is to be used for the physical layer transmission for each TTI.
13	- Interleaving
14	- No control of interleaving by higher layers. Pre-stored in a memory table
15	- Data modulation Higher order modulation scheme
16	- Modulation scheme is decided by MAC Scheduler (QPSK, 16QAM and 64QAM).
	- Mapping to physical resource
17	- L2-controlled resource assignment.
18	- Multi-antenna processing
19	- MAC Scheduler partly configures mapping from assigned resource blocks to the available number of antenna ports.
20	- Support of L1 control signalling Second transmission i.e. re- transmission based on a repeat
20	- Transmission of ACK/NAK and CQI feedback related to DL data transmission request i.e. NAK
21	The model of Figure 6.1.1 also captures
22	- Transport via physical layer of Hybrid-ARQ related information (exact info is FFS) associated with the PUSCH, to the peer HARQ process at the receiver side;
23	- Transport via physical layer of corresponding HARQ acknowledgements to PUSCH transmitter side.
24

64QAM 7.1.4

In case of 64QAM modulation, hextuplets of bits, b(i),b(i+1),b(i+2),b(i+3),b(i+4),b(i+5), are mapped to complexvalued modulation symbols x=I+jQ according to Table 7.1.4-1.

5		Table 7.1.4	I-1: 64QAM	I modulation mapping			
6	b(i), b(i+1), b(i+2), b(i+3), b(i+4), b(i+4)		Q	b(i), b(i+1), b(i+2), b(i+3), b(i+4), b(i+5)		9

45. On information and belief, Defendant has had at least constructive notice of the '961 Patent and '622 Patent by operation of law and marking requirements have been complied with. Swirlate is only asserting method claims in this complaint and as such the marking requirements of 35 U.S.C. 287(a) do not apply and have thus been complied with. Crown Packaging Technology, Inc. v. Rexam, Beverage Can Co., 559 F.3d 1308, 1316-1317 (Fed. Cir. 2009) ("Because Rexam asserted only the method claims of the '839 patent, the marking requirement of 35 U.S.C. 287(a) does not apply."); Hanson v. Alpine Valley Ski Area, Inc., 718 F.2d 1075, 1083 (Fed.Cir. 1983) ("It is 'settled in the case law that the notice requirement of this statute does not apply where the patent is directed to a process or method." (Quoting Bandag, Inc. v. Gerrard Tire Co., 704 F.2d 1578, 1581, 217 USPQ 977, 979 (Fed. Cir. 1983)); Intellectual Ventures I LLC v. Symantec Corp., 2015 U.S. Dist. LEXIS 6399 *3 (D.Del. Jan. 21, 2015).

VI. PRAYER FOR RELIEF

16 WHEREFORE, Plaintiff respectfully requests that the Court find in its favor and against 17 Defendant, and that the Court grant Plaintiff the following relief:

- Judgment that one or more claims of United States Patent Nos. 7,154,961 and a. 7,567,622 have been infringed, either literally and/or under the doctrine of equivalents, by Defendant;
- b. Judgment that Defendant account for and pay to Plaintiff all damages to and costs incurred by Plaintiff because of Defendant's infringing activities and other conduct complained of herein;
- 26 27 22-cv-0300 28 COMPLAINT - 73
