

IBM has a registered agent for service, CT Corporation System, located at 1999 Bryan Street, Suite 900, Dallas, TX 75201.

JURISDICTION AND VENUE

3. This is an action for patent infringement arising under the patent laws of the United States, 35 U.S.C. § 1 *et seq.*, including, without limitation, 35 U.S.C. §§ 271, 281, 284, and 285. This Court has jurisdiction over this action pursuant to 28 U.S.C. §§ 1331 and 1338(a).

4. This Court has specific and general personal jurisdiction over IBM consistent with the requirements of the Due Process Clause of the United States Constitution and the Texas Long Arm Statute because, *inter alia*, (i) IBM has engaged in continuous, systematic, and substantial business in Texas; (ii) IBM is registered to do business in Texas; (iii) IBM maintains regular and established places of business in this District, including at 1700 Summit Avenue, Plano, Texas 75074; 931 Litsey Road, Roanoke, Texas 76262, Texas; and 615 E. State Highway 121, Suite 33, Coppell, Texas, 75019, Texas; (iv) IBM has committed, directly or through intermediaries (including subsidiaries, agents, distributors, affiliates, retailers, suppliers, integrators, customers, and others), acts of patent infringement in this State. Such acts of infringement include making, offering to sell, selling, testing, and/or using Accused Products (as more particularly identified and described throughout this Complaint, below) in this State and this District and/or inducing others to commit acts of patent infringement in this State. Indeed, IBM has purposefully and voluntarily placed, one or more Accused Products into the stream of commerce through IBM's established distribution channels (including the Internet) with the expectation and intent that such products will be sold to and purchased by consumers in this State, and this District; and with the knowledge and expectation that such products (whether in standalone form or as integrated in downstream products) will be imported into this State, and this District.

5. IBM has derived substantial revenues from its infringing acts occurring within this State and this District. It has substantial business in this State and this District, including: (i) at least part of its infringing activities alleged herein; and (ii) regularly doing or soliciting business, engaging in other persistent conduct, and/or deriving substantial revenue from infringing goods offered for sale, sold, and imported, and services provided to Texas residents vicariously through and/or in concert with its agents, intermediaries, distributors, importers, customers, subsidiaries, and/or consumers.

6. This Court has personal jurisdiction over IBM, directly or through intermediaries (e.g., subsidiaries, agents, distributors, affiliates, retailers, suppliers, integrators, customers, and others), including its subsidiaries, e.g., SoftLayer Technologies, Inc. (“Softlayer”) and Red Hat, Inc. (“Red Hat”). Including through direction and control of such subsidiaries, IBM has committed acts of direct and/or indirect patent infringement within this State, this District and elsewhere within the United States giving rise to this action and/or has established minimum contacts with this forum such that the exercise of personal jurisdiction over IBM would not offend traditional notions of fair play and substantial justice.

7. Softlayer is a wholly owned subsidiary of the IBM. The primary business of Softlayer is providing cloud computing, storage, and infrastructure solutions, including the provision of the cloud infrastructure for the Accused Products and related services. Upon information and belief, IBM compensates Softlayer for sales, service, marketing, product development, and/or product support. As such, IBM has a direct financial interest in Softlayer, and vice versa.

8. Red Hat is a wholly owned subsidiary of the IBM. The primary business of Red Hat is providing enterprise software products and service solutions, including the provision of the

cloud foundation for the Accused Products via its software products (e.g., Red Hat OpenShift Container Platform). Upon information and belief, IBM compensates Red Hat for sales, service, marketing, product development, and/or product support. As such, IBM has a direct financial interest in Red Hat, and vice versa.

9. In addition, IBM has knowingly induced, and continues to knowingly induce, infringement within this District by advertising, marketing, offering for sale, and/or selling Accused Products that incorporate the fundamental technologies covered by the Asserted Patents. Such advertising, marketing, offering for sale and/or selling of Accused Products is directed to consumers, customers, manufacturers, integrators, suppliers, distributors, resellers, partners, and/or end users, and this includes providing tutorials, instructions, user manuals, advertising, and/or marketing materials facilitating, directing, and encouraging use of infringing functionality with IBM's knowledge thereof.

10. IBM has, thus, in the multitude of ways described above, availed itself of the benefits and privileges of conducting business in this State and willingly subjected itself to the exercise of this Court's personal jurisdiction over it. Indeed, IBM has sufficient minimum contacts with this forum through its transaction of substantial business in this State and this District and its commission of acts of patent infringement as alleged in this Complaint that are purposefully directed towards this State and District.

11. Venue is proper in the Eastern District of Texas pursuant to 28 U.S.C. § 1400(b) because, among other things, (i) IBM is subject to personal jurisdiction in this District; (ii) IBM has committed acts of patent infringement in this District and/or has induced acts of patent infringement by others in this District; and (iii) IBM has a regular and established place of business in Texas and in this District, including (a) at 1700 Summit Avenue, Plano, Texas 75074; (b) as a

result of substantial employees in this District; (c) as a result of IBM’s agents’ offices and operations in the District, such as the Cyrus One facility in Carrollton, Texas; and (d) substantial property holdings in this District (e.g., as shown in the below screenshots from searches of the Collin County and Denton County Appraisal District websites)

THE ASSERTED PATENTS AND TECHNOLOGY

12. Pardalis is the sole and exclusive owner of all right, title, and interest in the '696 Patent, the '869 Patent, the '668 Patent, the '000 Patent, the '765 Patent, the '902 Patent, and the '790 Patent and holds the exclusive right to take all actions necessary to enforce its rights in, and to, the Asserted Patents, including the filing of this patent infringement lawsuit. Pardalis also has the right to recover all damages for past infringements of the Asserted Patents.

¹ Collin County Appraisal District website, available at <https://www.collincad.org/propertysearch>.

² Denton County Appraisal District website, available at <https://www.dentoncad.com/>.

13. The '696 Patent is entitled, "Informational Object Authoring and Distribution System." The '696 Patent lawfully issued on December 30, 2003, and stems from U.S. Patent Application No. 09/934,951, which was filed on August 20, 2001. A copy of the '696 Patent is attached hereto as Ex. A.

14. The '869 Patent is entitled, "Common Point Authoring System for Tracking and Authenticating Objects in a Distribution Chain." The '869 Patent lawfully issued on November 14, 2006, and stems from U.S. Patent Application No. 10/684,045, which was filed on October 10, 2003. The '869 Patent is a continuation-in-part of the '696 Patent. A copy of the '869 Patent is attached hereto as Ex. B.

15. The '668 Patent is entitled, "Common Point Authoring System for the Complex Sharing of Hierarchically Authored Data Objects in a Distribution Chain." The '668 Patent lawfully issued on May 24, 2011, and stems from U.S. Patent Application No. 11/595,569, which was filed on November 10, 2006. The '668 Patent is a continuation-in-part of the '869 Patent. A copy of the '668 Patent is attached hereto as Ex. C.

16. The '000 Patent is entitled, "Common Point Authoring System for the Complex Sharing of Hierarchically Authored Data Objects in a Distribution Chain." The '000 Patent lawfully issued on November 6, 2012, and stems from U.S. Patent Application No. 13/086,997, which was filed on April 14, 2011. The '000 Patent is a continuation of the '668 Patent. A copy of the '000 Patent is attached hereto as Ex. D.

17. The '765 Patent is entitled, "Common Point Authoring System for the Complex Sharing of Hierarchically Authored Data Objects in a Distribution Chain." The '765 Patent lawfully issued on June 27, 2017, and stems from U.S. Patent Application No. 13/669,098, which

was filed on November 5, 2012. The '765 Patent is a continuation of the '000 Patent. A copy of the '765 Patent is attached hereto as Ex. E.

18. The '902 Patent is entitled, "Common Point Authoring System for the Complex Sharing of Hierarchically Authored Data Objects in a Distribution Chain." The '902 Patent lawfully issued on September 10, 2019, and stems from U.S. Patent Application No. 15/604,557, which was filed on May 24, 2017. The '902 Patent is a continuation of the '765 Patent. A copy of the '902 Patent is attached hereto as Ex. F.

19. The '790 Patent is entitled, "Common Point Authoring System for the Complex Sharing of Hierarchically Authored Data Objects in a Distribution Chain." The '790 Patent lawfully issued on September 21, 2021, and stems from U.S. Patent Application No. 16/563,788, which was filed on September 6, 2019. The '790 Patent is a continuation of the '902 Patent. A copy of the '790 Patent is attached hereto as Ex. G.

20. Pardalis and its predecessors complied with the requirements of 35 U.S.C. § 287, to the extent necessary, such that Pardalis may recover pre-suit damages.

21. The inventions claimed in the Asserted Patents relate generally to new and novel approaches to authoring, identifying, authenticating, tracking, and controlling informational objects that are authored in and along an ownership segmented commercial supply, distribution, or consumption chain. *See, e.g.*, '668 Patent, 1:18-26.³

22. The claims of the Asserted Patents are directed to patent eligible subject matter under 35 U.S.C. § 101. They are not directed to an abstract idea, and the technologies covered by

³ For convenience and readability, Pardalis cites herein to the '668 Patent, which shares a very similar specification to the '696 Patent, and a virtually identical specification to the '869 Patent, the '000 Patent, the '765 Patent, the '902 Patent, and the '790 Patent. Pardalis does not contend that the '668 Patent is representative of any other Asserted Patent.

the claims consist of ordered combinations of features and functions that, at the time of the invention, were not, alone or in combination, well-understood, routine, or conventional.

23. Indeed, the specifications of the Asserted Patents disclose shortcomings in the prior art and then explain, in detail, the technical ways in which the claimed inventions resolve or overcome those shortcomings. For example, the '668 Patent explains that there were numerous problems in the art, including that “[i]t is a problem in the field of product creation, product distribution, and/or product consumption to immutably author, maintain, and distribute intangible Informational Objects that identify a particular physical product or processed product as it progresses through an ownership segmented commercial supply, distribution, and consumption chain.” ’668 Patent, 1:32-38. More specifically, it was a problem to authenticate those informational objects, update the objects regarding history of a product, use the objects to track the products, and enable the objects to “become [their] own distinct commodity separate and apart from the commodity of the physical or proceed product to which the [] Object has reference.” *Id.* at 1:55-57. These problems were especially apparent in any industry that “operated under an ownership segmented structure which is based on separate production and distribution sectors.” *Id.* at 2:10-12.

24. Using the beef livestock industry as an example,⁴ the patent explains that these deficiencies lead to “information [that] is rarely passed up or down the supply distribution chain,”

⁴ The specification states that “the beef livestock industry is illustrative of the nature of this problem and is used as an example for the purpose of illustrating the operation of the present Common Point Authoring system but is not intended to limit the scope of the described system. The Common Point Authoring system may have application to any industry where information having reference to a physical or processed product has need to be authored, uniquely identified, authenticated, tracked, Owner controlled, advertised, sold, and/or purchased for compliance with governmental regulations and/or for commercial reasons.” ’668 Patent, at 3:6 –4:3 (emphasis added).

“variable product quality,” and “inefficiencies in information flow.” *Id.* at 2:23-67; *see also id.* at 10:54-57 (“[S]oftware systems that are presently available provide for the inventorying of identification information that is difficult and expensive to pass up and down the commercial chain.”); *see also id.* at 11:4-7 (“The beef livestock industry as a whole cannot improve its product because it cannot efficiently move information up and down the supply, distribution, and consumption chain.”). The applicants state that “the lack of information flow is not solvable without technologically addressing the issue of data ownership and control over Informational Objects.” *Id.* at 3:32-34. Prior to Pardalis’s inventions, however, “there [was] no globally accessible, centralized system in which Owners of animals or animal products, or Consumers of animal products, may uniquely identify and authenticate, track own and control, advertise, sell, and/or purchase Informational Objects having reference to animals and their products within the beef livestock industry’s supply, distribution, and consumption chain.” *Id.* at 3:45-51. Moreover, Pardalis explained that existing systems for identification, traceability, and data management were deficient because there was not “a globally accessible ‘umbrella’ information technology system that facilitates immutable authoring, unique identification, authentication, tracking, ownership and control, advertising, sale, and/or purchase of Informational Objects.” *Id.* at 11:12-17; *see also id.* at 11:22-23 (“[O]nly the promise of data ownership control can attract critical mass usage to and of a globally accessible system.”).

25. To solve these problems, the ’668 Patent discloses, and Pardalis developed and commercialized, among other things, a Common Point Authoring system that “automates the authoring, maintenance, and distribution of the Livestock Informational Objects by using an Internet-based paradigm and a centralized repository of unique-identified, immutable Data Elements.” *Id.* at 4:52-56. And further, that “[t]he system’s interconnectivity allows for the use of

an Internet-based paradigm for the purchase and sale of the data as commodities.” *Id.* at 4:63-65. “The Common Point Authoring system uses an object-oriented framework for communication,” and the Objects “are not document files or database files, but instead are objects that contain sequences of instructions and information on which the instructions operate.” *Id.* at 5:12-20. Further, each “Object contains pointers that identify a plurality of immutable “building blocks” of information that, when collected, comprise the [Object].” *Id.* at 5:21-25. And those building blocks also comprise data elements with corresponding unique identifiers. *Id.* The data elements are fixed and do not require updating; instead, a new version of an informational object would contain unique identifiers that point to a replacement data element that it maintained in a database. *Id.* 5:26-30.

26. The patents also provide a robust description of one embodiment of the inventions set forth in the specifications. For example, the “authoring means” for creating data that comprises an informational object is described in Figure 5 and at column 17, line 63 through column 19, line 5. First, “the Member’s identity is checked by the authentication server 141 against an authorized Member database 123.” *Id.* at 18:7-9. Then “the authoring client software module executing on the Member’s terminal device T1 is checked to identify the version of the software so that the authoring session executing of the Common Point Authoring system 10 can be compatible with the Member’s software.” *Id.* at 18:15-20. The Member can then “initiate[s] the authoring process” whereby the system “inserts various basic into the unregistered Livestock Informational Object.” *Id.* at 18:25-30.

27. Similarly, the specification describes an embodiment of the “authentication means” for authenticating the informational object that the member created. The informational object is checked “for proper content, format, and permissions,” and if it is proper, “the authoring server

143 of the Common Point Authoring System 10 generates a unique Livestock Informational Object identification and substitutes this for the filename created by the member.” *Id.* at 19:24-30. With respect to the “completion means for converting” the authenticated informational object into immutable form, the specification explains that the authoring server “date and time stamps” the informational object and “stores [it] in immutable form in the registered Informational Object database.” *Id.* at 19:30-35.

28. The specification further provides extensive discussion of managing digital rights using specific and non-generic components and systems. For example, the specification describes an embodiment with an improved and simplified “Subscriber management process” where “each prospective Subscriber who accesses the Common Point Authoring system 10 for enrollment purposes is uniquely defined by this identifier.” *Id.* at 14:31-35. Another embodiment is described in which the access to the informational objects “is managed pursuant to the offertory procedures set by the offering Member.” *Id.* at 21:24-27.

29. And the specification also describes how the “database management means” can write the immutable informational object into memory. “This subroutine creates a standard immutable Data Element that comprises the Member name for use in creating one or more Informational Objects, since the Member’s name appears on each Informational Object that the author creates. At step 411, the prospective Member enters the unique enrollment number assigned at step 305; and at step 412, the Common Point Authoring system 10 assigns the unique enrollment number as an identifier to the prospective Member’s name Data Element. At step 413, the prospective Member’s name and registered Data Element identifier are permanently added to the Member database 123, the subroutine ends, and processing exits at Step 414.” *Id.* at 17:31-43.

30. Indeed, while the claims of the seven Asserted Patents were never rejected under 35 U.S.C § 101 (three of which issued after the Supreme Court’s decision in *Alice Corp. Pty. Ltd. v. CLS Bank Int’l*, 573 U.S. 208 (2014)), during prosecution the applicant and the examiner relied on the aforementioned improvements to demonstrate that the claims were patentable.

31. For example, during the prosecution of the application that would issue as the ’869 Patent, the examiner found claims to be patentable because “the prior art of record fails to teach and/or suggest ‘enabling an authorized authoring member to create data comprising a draft information object, which uniquely identifies a product . . . a corresponding immutable informational object which is identified by a unique identifier . . . writing said created immutable information object into a memory . . .’, combined with ‘updating an information object by creating a new informational object relating back to said informational object...’ Ex. H at 16 (February 10, 2006 Office Action).⁵ Similarly, the examiner found claims in the application that would issue as the ’668 Patent to be allowable based on the following limitations: “draft data element means for enabling an authorized authoring member to create data comprising at least one draft data element: wherein said authoring means incorporates said at least one draft data element into said draft information object; wherein said authenticating means comprises: data element authenticating means for enabling an authorized individual to authenticate said draft data element created by said authorized authoring member; and wherein said completion means converts said authenticated at least one draft data element to a corresponding immutable draft data element which is identified by a unique identifier.” Ex. I at 24 (September 3, 2010 Office Action). And in a Notice of Allowance for the application that would issue as the ’000 Patent , the examiner stated the claims

⁵ Due to the size of the file history, Pardalis has only attached the exemplary relevant pages. The full file histories are publicly available and are incorporated by reference herein.

were allowable because of the following “uniquely distinct features”: “transmitting offer data from the authorized authoring member to members identified in the offer data to enable the identified members to access and change data corresponding to data that is contained in the immutable informational object; and enabling members identified in the offer data to access and change data corresponding to data that is contained in the immutable informational object to an extent and for a duration defined by permissions set by the authorized authoring member in the offer data, comprising: creating a copy of the immutable informational object, enabling an identified accessing member to revise data contained in the copy of the immutable informational object to the extent and for the duration defined by the permissions, and relating the copy of the immutable informational object, containing the revised data, to the immutable informational object.” Ex. J at 6-7 (August 3, 2012 Notice of Allowance).

32. As a further example, during prosecution of the application that would issue as the ’765 Patent(which occurred after *Alice*), the applicant argued that the claims were patentable over a patent cited by the examiner because that patent did not disclose the claimed “draft informational object, which uniquely identifies a product for tacking purposes,” any authentication of the draft informational object, or an immutable informational object. Ex. K at 83-84 (October 30, 2015 Amendment). Subsequently, the applicant argued that another cited patent failed to disclose unique identifiers for informational objects, but instead only identifiers for physical products, and thus there is no ability to “access and change said immutable informational objects.” Ex. K at 67 (July 21, 2016 Amendment). Still later, the application further argued that, unlike the cited patent, the pending claims “is directed to an automated document authoring and distribution system that enables subscribers to efficiently author, maintain and distribute informational objects that contain immutable content, such as products that are uniquely identified,” and that “the pending claim is

directed to the sharing of information in a supply chain with immutable objects authored by any number of independent-acting authors,” and that “the pending claim is directed to a method that allows authors to interact with an unknown independent member of the authored immutable object who may be several steps downstream, and maybe even at the end of the supply chain.” Ex. K at 12 (February 3, 2017 Amendment). The claims were then allowed.

33. While the seven patents that issued from these and other applications claim priority to the same application filed in 2001, the claims in those patents include elements that are significantly distinct from each other. Certain exemplary claims are recited below but Pardalis does not contend that these exemplary claims are representative of other claims within the Asserted Patents. Further, Pardalis emphasizes certain claim elements that are distinct and that are described in the specifications as solutions to disclosed problems, but does not contend that those emphasized elements are the only ones that demonstrate the patentability of the claims of the Asserted Patents.

34. Claim 12 of the '696 Patent:

A method for generating information objects, each of which contains a set of immutable data, comprising the steps of:

maintaining in a read-only mode, a plurality of immutable data elements, each of which is identified by a unique identifier;

maintaining in a read-only mode, a set of data that defines an informational object, said set of data comprising a plurality of said unique identifiers that correspond to a selected set of said plurality of data elements;

enabling an authorized authoring member to create data comprising at least one of a draft data element and a draft informational object;

authenticating said at least one of a draft data element and a draft informational object created by said authorized authoring member;

converting said authenticated at least one of a draft data element and a draft informational object created by said authorized authoring member to a

corresponding immutable at least one of a data element and an informational object;

writing said created immutable at least one of a data element and an informational object into a memory for use by said first and said second means for maintaining.

35. Claim 9 of the '869 Patent:

A method for maintaining data for use by authoring and accessing members to track uniquely identified products, comprising:

enabling an authorized authoring member to create data comprising a draft informational object, ***which uniquely identifies a product for tracking purposes;***

authenticating said draft informational object created by said authorized authoring member;

converting said authenticated informational object created by said authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier;

writing said created immutable informational object into a memory for use by authorized accessing members; and

updating an informational object by creating a new informational object relating back to said informational object and containing new data.

36. Claim 1 of the '668 Patent:

A common point authoring system for complex sharing of hierarchically authored data objects in a distribution chain, comprising:

authoring means for enabling an authorized authoring member to create data comprising a draft informational object, which uniquely identifies a product for tracking purposes;

authenticating means for enabling an authorized individual to authenticate said draft informational object created by said authorized authoring member;

completion means for converting said authenticated informational object created by said authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier;

database management means for writing said created immutable informational object into a memory for use by authorized accessing members;

draft data element means for enabling an authorized authoring member to create data comprising at least one draft data element;

wherein said authoring means incorporates said at least one draft data element into said draft informational object;

wherein said authenticating means comprises:

data element authenticating means for enabling an authorized individual to authenticate said draft data element created by said authorized authoring member; and

wherein said completion means converts said authenticated at least one draft data element to a corresponding immutable draft data element which is identified by a unique identifier.

37. Claim 8 of the '000 Patent:

A common point authoring system for maintaining data for use by authoring and accessing members to track uniquely identified products, comprising:

an authoring server for enabling an authorized authoring member to create data comprising a draft informational object;

an informational object database for maintaining in a read-only mode a set of data that defines an informational object, the set of data comprising a plurality of the unique identifiers that correspond to a selected set of a plurality of data elements;

an authentication server for authenticating the draft informational object created by the authorized authoring member;

an authoring server for converting the draft informational object created by the authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier;

a database manager for writing the created immutable informational object into the informational object database;

an offer transmitter for *transmitting offer data from the authorized authoring member to members identified in the offer data to enable the identified members to access and change data corresponding to data that is contained in the immutable informational object;* and

an informational object offertory server for *enabling members identified in the offer data to access and change data corresponding to data that is contained in the immutable informational object to an extent and for a duration defined by*

permissions set by the authorized authoring member in the offer data, comprising:

a copy process for *creating a copy of the immutable informational object,*

an informational object editor for *enabling an identified accessing member to revise data contained in the copy of the-immutable informational object to the extent and for the duration defined by the permissions,* and

an informational object accessing member authoring server for *relating the copy of the immutable informational object, containing the revised data, to the immutable informational object.*

38. Claim 1 of the '765 Patent:

A method for maintaining data for use by authoring and accessing members to track uniquely identified products and informational objects, comprising:

enabling an authorized authoring member to create data comprising a draft informational object, which uniquely identifies a product for tracking purposes;

authenticating said draft informational object, which uniquely identifies the product for tracking purposes, created by said authorized authoring member;

converting said authenticated informational object created by said authorized authoring member to a *corresponding immutable informational object which is identified by a unique identifier for tracking the immutable informational object;*

writing said created immutable informational object into a memory *for use by independent authorized accessing members;* and

enabling, in response to receipt of offer data from said authorized authoring member, an independent member identified in said offer data to access and change said immutable informational object to an extent and for a duration defined by permissions set by said authorized authoring member in said offer data.

39. Claim 6 of the '902 Patent:

A common point authoring system for maintaining data for use by authoring and accessing members to track uniquely identified products and informational objects, comprising:

an authoring server for enabling an authorized authoring member to create data comprising a draft informational object, which uniquely identifies a product for tracking purposes;

an authentication server for authenticating the draft informational object, which uniquely identifies the product for tracking purposes, created by the authorized authoring member;

an authoring server for converting the authenticated informational object created by the authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier for tracking the immutable informational object;

a database manager for writing the created immutable informational object into a memory for use by independent authorized accessing members; and

an informational object offertory server, for enabling, in response to receipt of offer data from the authorized authoring member, an independent member identified in the offer data to access and change the immutable informational object to an extent and for a duration defined by permissions set by the authorized authoring member in the offer data.

40. Claim 1 of the '790 Patent:

A method for maintaining data for use by authoring and accessing members to track uniquely identified processed products and informational objects, comprising:

enabling an authorized authoring member to create data comprising a draft informational object, *which uniquely identifies a processed product for tracking purposes*;

authenticating the draft informational object, which uniquely identifies the processed product for tracking purposes, created by the authorized authoring member;

converting authenticated informational object created by the authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier for tracking the immutable informational object;

writing the created immutable informational object into a memory for use by independent authorized accessing members;

enabling, in response to receipt of offer data from the authorized authoring member, an independent member identified in the offer data to

access a copy of the immutable informational object to an extent and for a duration defined by permissions set by the authorized authoring member in the offer data; and

revise data contained in the copy of the immutable informational object to the extent and for the duration defined by the permissions.

41. Pardalis's own contemporaneous documentation of its patented technologies further demonstrate that patents are directed to non-abstract improvements. For example, in 2004 Pardalis published a white paper entitled "*Author-Level Digital Rights Management and the Common Point AuthoringTM System: Protecting Information Exchange.*" See Ex. L. In that paper, Pardalis stated that its patented Common Point Authoring System addressed challenges such as "the need for an infrastructure capable of linking the thousands of organizations that produce information" and "the need to protect the interests of each of these individual information producers." *Id.* at 1. Pardalis explained that before its technology, information was protected through Standard Digital Rights Management technology such as encrypting content and providing licenses, but that those techniques did not adequately protect information produced by multiple authors in a complex environment. *Id.* at 2. To address this, Pardalis's technology provided rights management at the level of informational elements produced within such a system, and packaged those elements with unique digital identifiers. *Id.* Further, Pardalis's technology allowed for control of how and to whom such information could be distributed and used. *Id.*

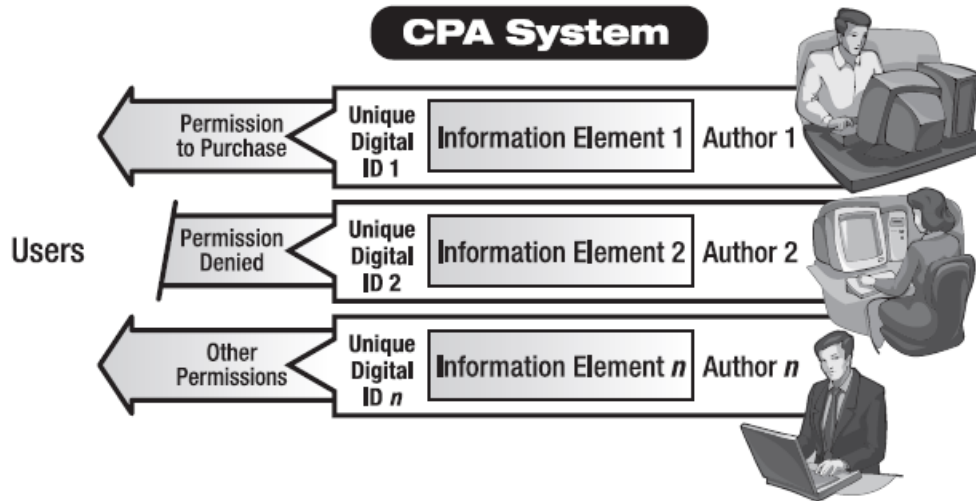

Figure 3. The CPA System allows multiple authors to control information usage

Ex. L at 2.

42. Thus, consistent with the disclosures of the Asserted Patents, and the arguments made to the U.S. Patent and Trademark Office during prosecution of those patents, Pardalis contemporaneously described how its novel technologies improved upon extant, in the early 2000s, approaches to tracking products through complex, segmented supply chains.

43. In 2007, Pardalis began publishing “THE @WHOLECHAIN™ BLOG” on its website, www.pardalis.com. At that time, the term “blockchain” had still not been coined, and Satoshi Nakamoto’s paper about Bitcoin would not be published until late 2008.

44. Thus, at a minimum, the claims of the Asserted Patents are “necessarily rooted in computer technology in order to overcome [] problem[s] specifically arising in the realm of computer networks.” *DDR Holdings, LLC v. Hotels.com, L.P.*, 773 F.3d 1245, 1247 (Fed. Cir. 2014). And, as the Asserted Patents explain, the claimed inventions are directed to and solve “challenge[s] particular to the Internet.” *Id.* at 1257. The claimed inventions are directed to and solve problems with tracking informational data objects within a complex, segmented distribution chain. ’668 Patent, 1:32-38, 2:23-67, 11:4-7. The claimed inventions are directed to and solve

problems with maintaining consistency and compatibility of informational data objects authored by different sources throughout a computer network such as the Internet. *Id.* at 2:10-12, 3:45-51, 11:12-17. The claimed inventions are directed to and solve problems of ensuring authenticity of data objects authored through a distribution chain. *Id.* at 1:55-57, 3:32-34. Specifically, the Asserted Patents explain that because “software systems that are presently available provide for the inventorying of identification information that is difficult and expensive to pass up and down the commercial chain,” *see* ’668 Patent, 11:4-7, Pardalis’s claims are directed to a patented Common Point Authoring system that use “an Internet-based paradigm” to automatically immutably author, authenticate, maintain, and distribute intangible and uniquely-identified, immutable informational objects and data elements to trace products through a complex, segmented, commercial distribution chain. *See, e.g., id.* at 1:31-38, 1:55-57, 4:53-56. The claims are directed to methods and systems of managing digital rights using specific and non-generic components and steps. *See, e.g., id.* at 11:12-17; 14:31-35, 21:24-27; *see also ContentGuard Holdings, Inc. v. Amazon.com, Inc.*, 142 F. Supp. 3d 510, 515 (E.D. Tex. 2015). These claims are therefore directed to non-abstract, specific improvements in computer and/or network functionalities. *See TecSec, Inc. v. Adobe Inc.*, 978 F.3d 1278, 1293 (Fed. Cir. 2020); *see also Enfish, LLC v. Microsoft Corp.*, 822 F.3d 1327, 1335-36 (Fed. Cir. 2016).

45. To address the extant problems within global, segmented, distribution chains, the claims of the Asserted Patents contain numerous elements drawn to inventive concepts that are more than well-understood, routine, conventional activities previously known to the industry. *Cosmokey Sols. GMBH & Co. KG v. Duo Sec.*, 15 F.4th 1091, 1097-1098 (Fed. Cir. 2021).

46. For example, the specification and claims describe a Common Point Authoring system that automates the authoring, maintenance, and distribution of informational objects by

using an Internet-based paradigm and a repository of uniquely-identified, immutable data elements. '668 at 4:52-56. The patents tout the system's interconnectivity, which allows for the purchase and sale of the data as commodities." *Id.* at 4:63-65. Thus, the claims recite specific solutions to Internet-centric problems. *DDR Holdgins, LLC v. Hotels.com, L.P.*, 773 F.3d 1245, 1257 (Fed. Cir. 2014).

47. Moreover, the patents describe that the informational objects contain pointers that identify a plurality of immutable 'building blocks' of information that, when collected, comprise the object. '668 at 5:21-25. And those building blocks also comprise data elements with corresponding unique identifiers. *Id.* The data elements are fixed and do not require updating; instead, a new version of an informational object would contain unique identifiers that point to a replacement data element that it maintained in a database. *Id.* at 5:26-30.

48. Still further, the patents explain that the system authenticates the informational objects and data elements themselves, not just the identities of authorized members, by checking for proper content, format, and permissions, and that an authoring server the system generates a unique informational object identification and substitutes this for the filename created by the member. *Id.* at 19:24-30. And the system then converts the authenticated informational objects into immutable form that is stored in ready only memory. *Id.* at 19:30-35.

49. Notably, during prosecution, these same solutions were cited to overcome prior art and for the bases of patentability. *Coop. Entm't, Inc. v. Kollektive Tech., Inc.*, 50 F.4th 127, 135 (Fed. Cir. 2022).

50. Thus, the elements in the various claims, both individually and as an ordered combination, recite inventive concepts. *Weisner v. Google LLC*, 51 F.4th 1073, 1083 (Fed. Cir. 2022). These limitations, as well as others, are substantial, meaningful, and concrete, and which

tie the claims down and remove them from essentially affecting a monopoly on the allegedly abstract idea of merely doing business.

THE IBM ACCUSED PRODUCTS

51. IBM makes, uses, sells, offers for sale, and/or imports certain IBM products, their components and processes, including software and application integration systems that incorporate the fundamental technologies covered by the Asserted Patents and/or practice the subject matter claimed by the Asserted Patents including, but not limited to, (i) IBM Blockchain on Bluemix; (ii) IBM Blockchain Platform v1.0; (iii) IBM Blockchain Platform for IBM Cloud; (iv) IBM Blockchain Platform for Anywhere; (v) IBM Blockchain Platform for IBM Cloud Private; (vi) IBM Blockchain Platform for Multicloud; (vii) IBM Blockchain Platform: Hyperledger Fabric Support Edition; and (viii) IBM's Blockchain Solutions (i.e., specialized applications of IBM Blockchain), including, but not limited to, IBM Blockchain Transparent Supply, IBM Food Trust, IBM Blockchain World Wire, IBM Digital Health Pass, as well as internal use by IBM (collectively, the "Accused Products").

52. On information and belief, each Accused Product implements a permissioned blockchain platform that is "a shared, immutable ledger that facilitates the process of recording transactions and tracking assets in a business network."⁶ As IBM explains, "[d]ata on the blockchain is replicated, shared and synchronized among parties on a distributed ledger without the need for a central administrator. Unlike owned and managed databases, blockchain provides an independent data-sharing platform."⁷

⁶ Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 3 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>.

⁷ *IBM Food Trust: Onboarding Overview* at p. 3, IBM (2020), available at <https://www.ibm.com/downloads/cas/ZPY6EAMW>.

53. As IBM explains, “[t]he blockchain solution we built captures information about the asset as it moves from party to party in the supply chain (from manufacturer to IBM) and as the state of the asset is modified (for example, capitalized). Capturing this information in the blockchain gives IBM and its supply chain partners a single source of truth with regard to core asset information.”⁸ To do so, each Accused Product implements the use of distributed ledger technology, immutable records, and smart contracts to generate and share a series of connected blocks within a permissioned and distributed ledger across a peer-to-peer network, as shown below:

FIGURE 1-1: Business networks before and after blockchain.

Manav Gupta, *Blockchain for Dummies: IBM Limited Edition*, at p. 7 (2017).

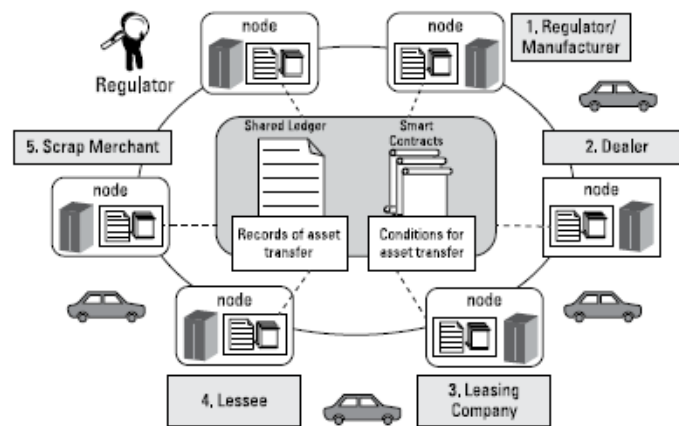

FIGURE 1-3: Tracking vehicle ownership with blockchain.

Manav Gupta, *Blockchain for Dummies: IBM Limited Edition*, at p. 8 (2017).

⁸ *Adopting blockchain for enterprise asset management (EAM)*, IBM (last updated Feb. 6, 2019), available at <https://developer.ibm.com/tutorials/cl-adopting-blockchain-for-enterprise-asset-management-eam/>.

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: IBM Limited Edition*, at p. 14 (2017).

54. On information and belief, each Accused Product is based on trusted identities. For example, each Accused Product utilizes one or more certificate authorities to generate unique identities as well as any associated certificates for each permissioned user, which enables the use of policies to constrain network participation (e.g., to read and/or write the shared ledger), as shown below:

CA

The importance of identities

Registering and enrolling using certificate authorities

}

- Managing identity is a **critical part** of a network
 - All users and components have an identity
 - These are managed in the console under the CA node
 - Make a note of what identities are used where; avoid reuse
- Two step process helps ensure admins can't hijack identities
 - CA admin **registers** the identity in the CA with an enroll ID and secret; passes details to identity owner
 - Owner **enrolls** the identity using these details (e.g. when creating nodes); certificates are generated for the owner to work with.
- Certificates are stored in wallets and stay in local browser storage by default
 - Certificates can move between wallets but are not managed by IBM.
 - Take care when switching browsers!

IBM Blockchain
IBM

IBM Blockchain Platform Technical Series: Using IBM Blockchain Platform at p. 14 (Nov. 21, 2019, version 1.1).

The importance of identity

- Every **actor** has an associated X.509 **identity** issued by its organization's **Certificate Authority**
- A **peer, orderer, application, organization, CA** uses its identity to determine its **organizational role**
- This **role determines** the level of **access** an actor has to network resources, e.g. read/write the ledger

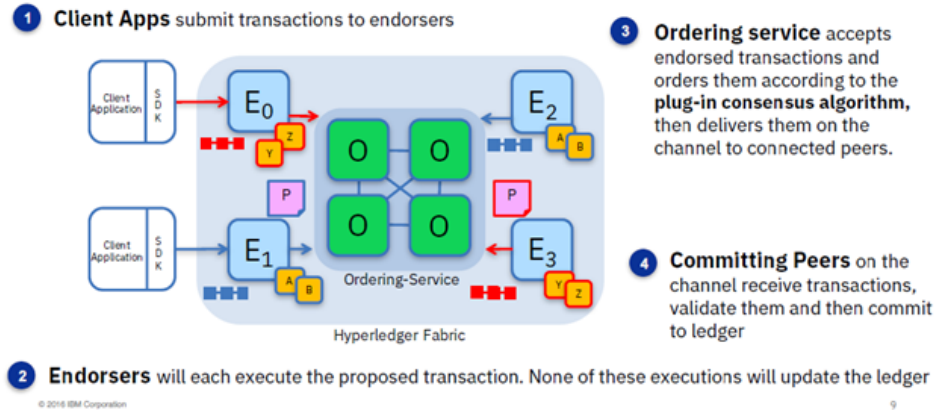

IBM Blockchain Platform: Technical Introduction, at p. 14 (2019, version 1.1).

Role to permission mapping

Role	Permissions
Manager	<p>As a Manager, you have permissions beyond the Writer role. You can do everything a Reader and Writer can do as well as:</p> <ul style="list-style-type: none"> • Provision new components such as CAs, peers, and ordering services, by using the console or APIs. • Delete provisioned components by using the console or APIs. • Add/remove users and change user access policies. • Change console logging levels by using the console or APIs. • Restart the console by using an API.
Writer	<p>As a Writer, you have permissions beyond the Reader role, including:</p> <ul style="list-style-type: none"> • Import components by using the console or APIs. • Remove imported components by using the console or APIs. • Register users on a CA. • Add or remove notifications by using the console or APIs.
Reader	<p>As a reader, you can perform read-only actions including:</p> <ul style="list-style-type: none"> • View console UI. • View console log. • Export components. • Issue any GET API.

Administering Your Console, IBM (last updated Nov. 2, 2020), available at <https://cloud.ibm.com/docs/blockchain-sw?topic=blockchain-sw-console-icp-manage>.

55. On information and belief, each Accused Product leverages a checks and balances protocol that ensures transactions are valid, accurate, and verified. For example, as IBM explains, “a transaction process includes: [i] initiation by an authorized client, [ii] verification and signing by endorsers, [iii] inspection and validation of endorser responses, then [iv] validation of the transaction by all peers on the network. All of this must perform successfully before a new block can be appended to the blockchain. For enterprise use, distributed ledger technology must be capable of ensuring data is secure, transparent and final.”⁹ Examples of this transaction process are illustrated below:

IBM Blockchain Overview, IBM, at p. 9 (2017).

⁹ *IBM Blockchain Platform: Technical Overview* at p. 3, IBM (2022), available at <https://www.ibm.com/downloads/cas/Q9DGBLV7>.

Transaction Flow

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority>.

56. On information and belief, each Accused Product enables a permissioned client to create data via the submission of a transaction proposal. For example, the transaction proposal may be generated by a smart contract—a business logic component that is agreed upon by the participants of the blockchain network. Once the transaction proposal is generated, it is submitted to other permissioned users, (e.g., Peers A and B illustrated below), on the specified channel for endorsement using an application specification interface such as SDK, as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

Transaction Flow, available at <https://hyperledger-fabric.readthedocs.io/en/release-1.4/txflow.html> (emphasis added).

57. On information and belief, each Accused Product employs an endorsement mechanism that enables each permissioned peer to verify the signature of each received transaction proposal and to simulate the execution of the input transaction against a smart contract. As IBM

explains, the endorsement mechanism “is an important part of the network consensus algorithm in the IBM Blockchain Platform”¹⁰ to ensure the authenticity of the transaction proposal.

58. On information and belief, once the transaction proposal is endorsed, the Accused Products enable the application specification interface (e.g., SDK) to forward the endorsed transaction(s) to an ordering service, which converts the endorsed transaction(s) into an ordered transaction (containing the endorsed transaction proposals), as shown below:

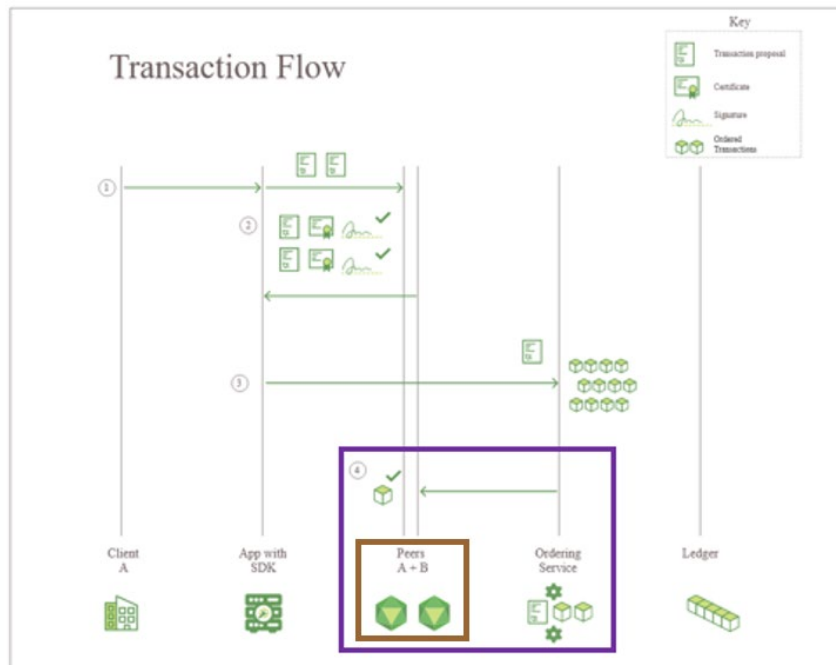

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

¹⁰ David Gorman, *Introduction to the endorsement of transactions in a business network*, IBM Developer (2018), available at <https://developer.ibm.com/articles/an-introduction-to-the-endorsement-of-transactions-in-a-business-network/>.

Transaction Flow, available at <https://hyperledger-fabric.readthedocs.io/en/release-1.4/txflow.html> (emphasis added).

59. On information and belief, once the endorsed transaction(s) are converted into an ordered transaction, each Accused Product distributes the ordered transaction containing one or more endorsed transaction proposals from the ordering service to the channel peers on the network for validation, as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

Transaction Flow, available at <https://hyperledger-fabric.readthedocs.io/en/release-1.4/txflow.html>.

60. On information and belief, each Accused Product employs a consensus protocol/mechanism to check the validity of each endorsed transaction proposal within the ordered transaction. As IBM explains, “[a] consensus protocol agreed to by all participating members of the business network ensures that the ledger is updated only with network-verified transactions.”¹¹ Once authenticated via the aforementioned validation process, each Accused Product converts the ordered transaction into an immutable block (which is identified by a block hash) and appends it to the record (i.e., block) preceding it on the shared ledger of the network via each peer on the channel, as shown below:

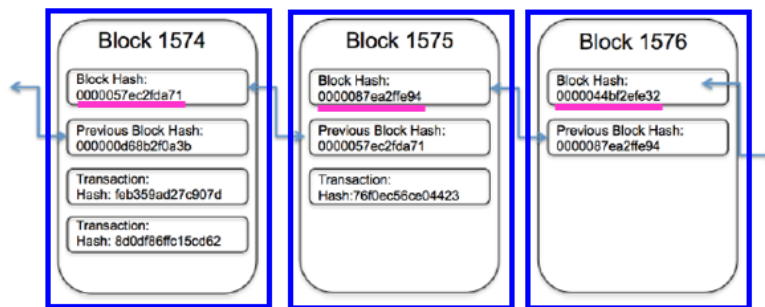

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

¹¹ *Blockchain Basics: Introduction to Distributed Ledgers*, IBM (last updated June 1, 2019), available at <https://developer.ibm.com/tutorials/cl-blockchain-basics-intro-bluemix-trs>.

61. As illustrated above, each immutable block contains its own hash as well as the hash of the previous immutable block. “The previous block hash links the blocks together and prevents any block from being altered or a block being inserted between two existing blocks. In this way, each subsequent block strengthens the verification of the previous block and hence the entire blockchain.”¹² This prevents any authoring or accessing user from tampering with any already-recorded transaction. By doing so, the Accused Products ensure that all data is permanently recorded as immutable blocks—meaning data will never be altered or deleted. As IBM explains, “[t]his means that once data is entered on the blockchain, it cannot be deleted (unlike data in a database). Edits can be made only by appending new or updated information. With blockchain, you have a permanent record or audit trail of all data entered and edited. No one can edit information without your knowledge.”¹³ Once appended to the shared distributed ledger, the immutable block has been written into a permanent memory where it is maintained for use by users (e.g., to access, inspect, or add to the data via the creation of a new block).

62. On information and belief, each Accused Product further enables permissioned users to track a transaction and/or asset using the unique identifier associated with that a transaction/asset. For example, IBM’s Food Trust blockchain solution (an IBM blockchain industry-specific solution) uses IBM’s blockchain technology to improve transparency, standardization and efficiency throughout the food supply chain, as shown below:

¹² Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>.

¹³ *IBM Food Trust: Onboarding Overview* at p. 3, IBM (2020), available at <https://www.ibm.com/downloads/cas/ZPY6EAMW>.

IBM Food Trust offers industry-specific functionality targeted at key pain points

Blockchain Explained Series: Solutions Explained at p. 9, IBM (Aug. 8, 2019, v0.6).

Figure 3. Transactions and events

Adopting blockchain for enterprise asset management (EAM), IBM (last updated Feb. 6, 2019), available at <https://developer.ibm.com/tutorials/cl-adopting-blockchain-for-enterprise-asset-management-eam/>.

Specifically, IBM’s Food Trust blockchain solution enables users to track a food product’s information as it travels throughout the supply chain from the farmer, processor, retailer, and consumer. In doing so, IBM’s Food Trust blockchain solution provides authorized users with immediate access to actionable food supply chain data, including “complete history and current

location of any food item along with its accompanying information.”¹⁴ For example, IBM’s Food Trust blockchain solution enabled user(s) to “trace a package of sliced mangos back to the farm,”¹⁵ as shown below:

Blockchain Explained Series: Solutions Explained at p. 9, IBM (Aug. 8, 2019, v0.6).

63. Along with IBM’s Food Trust blockchain solution, IBM also offers additional industry specific solutions that target other sectors such as banking and financial services, automotive industries, government, healthcare and life sciences, insurance, media and entertainment, retail and consumer goods, telecommunications, travel and transportation, supply chain, oil and gas, and manufacturing. These solutions include, but are not limited to, IBM Transparent Supply, IBM Blockchain World Wire, and IBM Digital Health Pass.

64. The technology discussion above and the exemplary Accused Products provide context for Plaintiff’s infringement allegations contained herein.

¹⁴ *About IBM Food Trust* at p. 3, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

¹⁵ *Blockchain Explained Series: Solutions Explained* at p. 9, IBM (Aug. 8, 2019, v0.6).

COUNT I

(INFRINGEMENT OF U.S. PATENT NO. 6,671,696)

65. Plaintiff incorporates the preceding paragraphs herein by reference.

66. This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, *et seq.*

67. Pardalis is the owner of all substantial rights, title, and interest in and to the '696 Patent including the right to exclude others and to enforce, sue, and recover damages for past infringements.

68. The '696 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on December 30, 2003, after full and fair examination.

69. IBM has directly and/or indirectly infringed (by inducing infringement) one or more claims of the '696 Patent in this District and elsewhere in Texas and the United States by making, offering to sell, selling, testing, and/or using, and by actively inducing others to make, use, sell, offer to sell, and/or import, IBM products, their components and processes, and/or products containing the same that incorporate the fundamental technologies covered by the '696 Patent, including, but not limited to, the Accused Products.

Direct Infringement (35 U.S.C. § 271(a))

70. IBM has directly infringed one or more claims of the '696 Patent in this District and elsewhere in Texas and the United States.

71. IBM has directly infringed, either by itself or via its agent(s), at least claim 12 of the '696 Patent¹⁶ as set forth under 35 U.S.C. § 271(a) by making, offering to sell, selling, testing, and/or using the Accused Products.

72. By way of illustration only, IBM, via the Accused Products, perform each and every element of claim 12 of the '696 Patent. The Accused Products perform “a method for generating information objects, each of which contains a set of immutable data.” For example, each Accused Product generates a series of connected blocks [information objects] within an append-only distributed system of records (i.e., a shared ledger), via a common point authoring system, wherein each block contains a set of immutable data related to a transaction or series of transactions [immutable data] as demonstrated below:

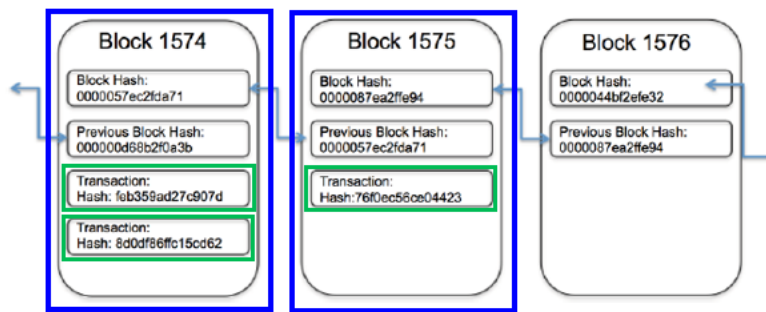

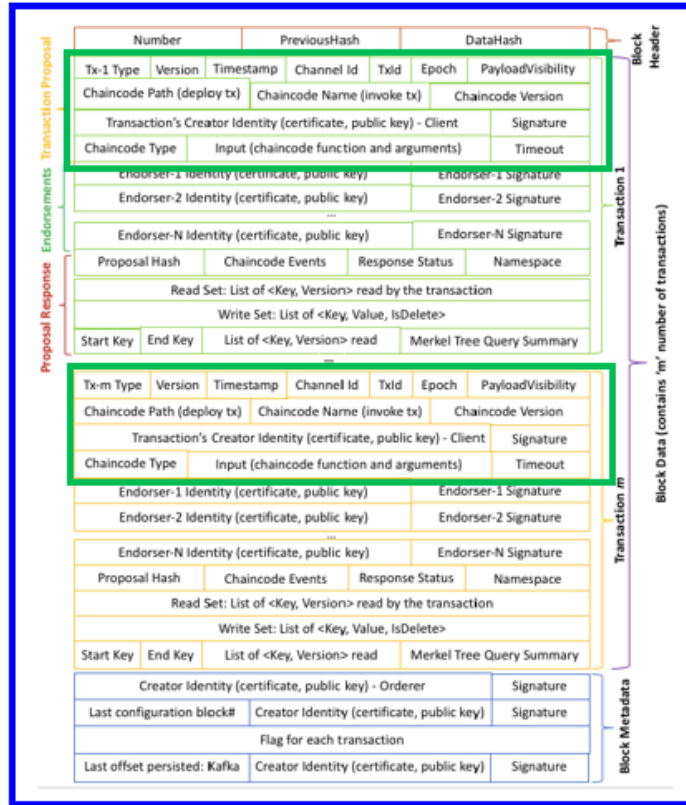

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

¹⁶ Throughout this Complaint, wherever Pardalis identifies specific claims of the Asserted Patents infringed by IBM, Pardalis expressly reserves the right to identify additional claims and products in its infringement contentions in accordance with applicable local rules and the Court’s case management order. Specifically identified claims throughout this Complaint are provided for notice pleading only.

Parth Thakkar, et al., *Performance Benchmarking and Optimizing Hyperledger Fabric Blockchain Platform*, at p. 3 (2018) (emphasis added).

73. The Accused Products practice “maintaining in a read-only mode, a plurality of immutable data elements, each of which is identified by a unique identifier.” For example, each Accused Product maintains information related to a transaction or series of transactions [data element] (e.g., who, what, when, where, cost, and condition)¹⁷ in a read-only mode, via an append-only shared ledger that prevents any modification to the transaction data once it has been recorded to the shared ledger. If a transaction is in error within the Accused Products, a new transaction

¹⁷ *What is Blockchain Technology?*, IBM, available at <https://www.ibm.com/topics/what-is-blockchain> (“The data block can record the information of your choice: who, what, when, where, how much and even the condition – such as the temperature of a food shipment.”).

must be used to reverse the error, and both transactions are then visible on the shared ledger. As demonstrated below, each transaction is further identified by a unique hash/transaction ID:

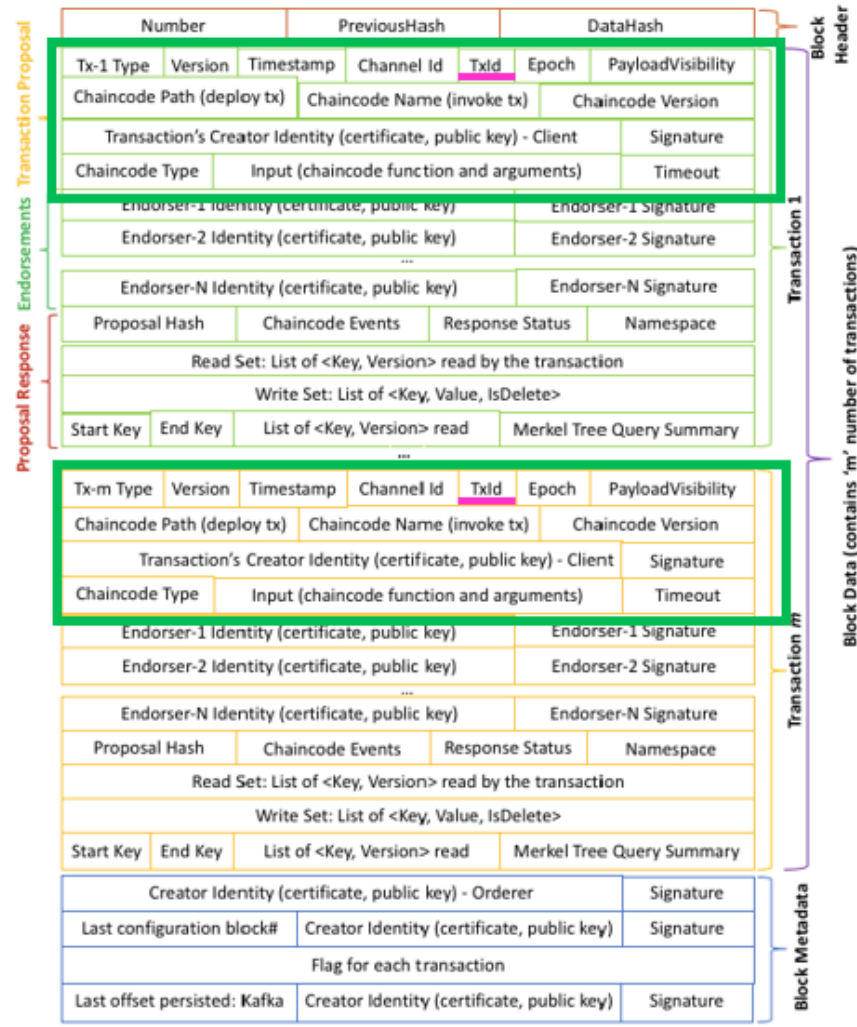

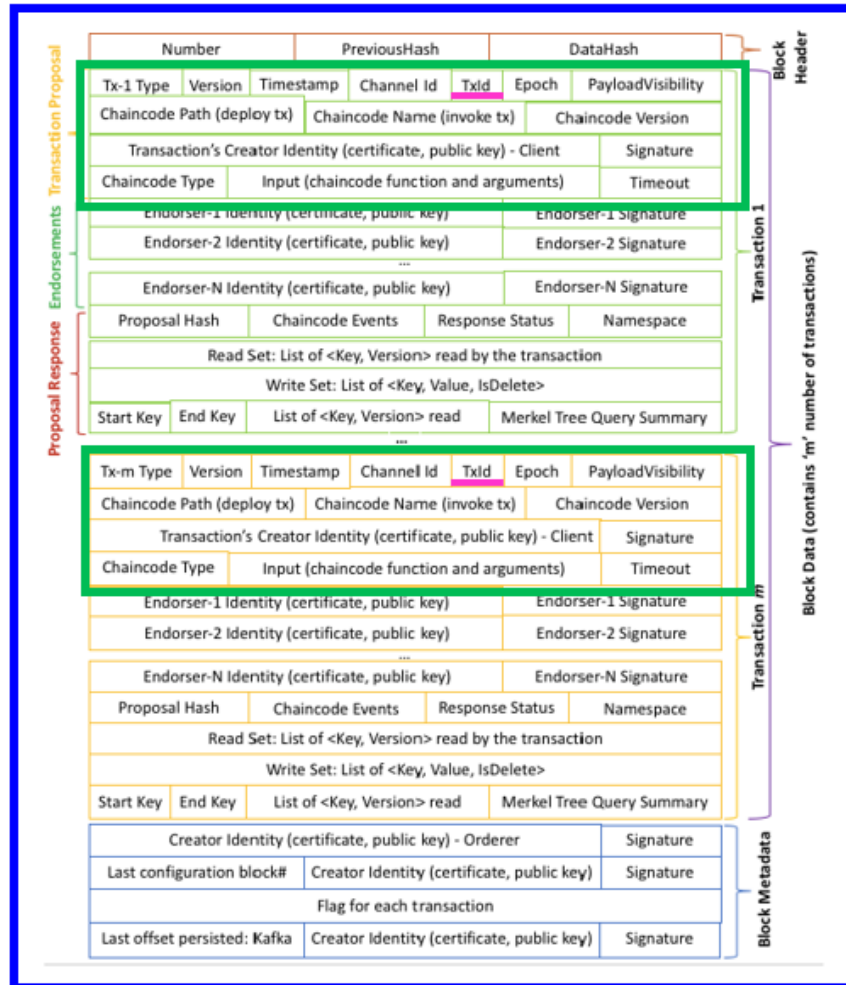

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

Parth Thakkar, et al., *Performance Benchmarking and Optimizing Hyperledger Fabric Blockchain Platform*, at p. 3 (2018) (emphasis added).

74. The Accused Products practice “maintaining in a read-only mode, a set of data that defines an informational object, said set of data comprising a plurality of unique identifiers that correspond to a selected set of said plurality of data elements.” For example, each Accused Product maintains information related to a series of multiple transactions that defines a block in a read-only mode, wherein the multiple transactions are each identified by a unique transaction hash/transaction ID (e.g., TxId) within the defined block, as illustrated below:

Parth Thakkar, et al., *Performance Benchmarking and Optimizing Hyperledger Fabric Blockchain Platform*, at p. 3 (2018) (emphasis added).

75. As discussed above, the Accused Products maintain in a read-only mode, a plurality of data elements that is each identified by a unique identifier. That set of data that is comprised of a plurality of data elements defines a block. Multiple transactions may be bundled together to form one block. For example, Block 1574 of Figure 2-1 in the illustration above demonstrates a plurality of transactions within one block, each of which is identified by its corresponding unique transaction hash/transaction ID.

76. The Accused Products practice “enabling an authorized authoring member to create data comprising at least one of a draft data element and a draft informational object.” For example,

each Accused Product enables a permissioned client [authorized authoring member], via one or more certificate authorities, to create one or more transaction proposals [draft data element] and one or more ordered transactions [draft informational object]. Specifically, the Accused Products utilize one or more certificate authorities to generate unique identities for each permissioned user, which enables the use of policies to constrain network participation (e.g., to read and/or write the shared ledger) and access to transaction details, as shown below:

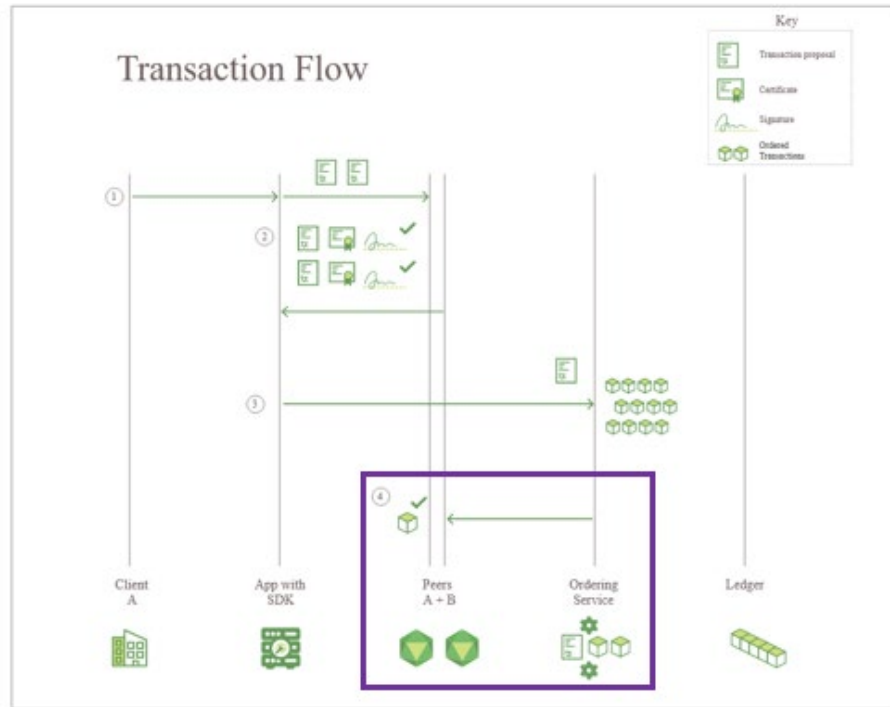

The importance of identity

- Every actor has an associated X.509 identity issued by its organization's Certificate Authority
- A peer, orderer, application, organization, CA uses its identity to determine its organizational role
- This role determines the level of access an actor has to network resources, e.g. read/write the ledger

IBM Blockchain Platform: Technical Introduction, at p. 14 (2019, version 1.1).

77. The Accused Products practice “authenticating said at least one of a draft data element and a draft informational object created by said authorized authoring member.” For example, each Accused Product authenticates each endorsed transaction proposal within the ordered transaction via a consensus protocol. Specifically, each Accused Product distributes the ordered transaction containing one or more endorsed transaction proposals from the ordering service to the channel peers on the network for validation, as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

78. During the validation process, each Accused Product employs a consensus protocol/mechanism to check the validity of each endorsed transaction proposal within the ordered transaction. As IBM explains, “[a] consensus protocol agreed to by all participating members of the business network ensures that the ledger is updated only with network-verified transactions.”¹⁸ Therefore, the Accused Products authenticate as required by claim 12 of the ’696 Patent via the validation process.

79. The Accused Products practice “converting said authenticated at least one of a draft data element and a draft informational object created by said authorized authoring member to a corresponding immutable at least one of a data element and an informational object.” For example,

¹⁸ *Blockchain Basics: Introduction to Distributed Ledgers*, IBM (last updated June 1, 2019), available at <https://developer.ibm.com/tutorials/cl-blockchain-basics-intro-bluemix-trs>.

once the peers authenticate each endorsed transaction proposal [draft data element] within the ordered transaction [draft informational object] via the aforementioned validation process, each Accused Product converts this ordered transaction containing the endorsed transaction proposals into an immutable block containing validated transactions.

80. The Accused Products practice “writing said created immutable at least one of a data element and an informational object into a memory for use by said first and said second means for maintaining.” For example, each Accused Product appends [writes] each authenticated block containing validated transactions [created immutable] to the record (i.e., block) preceding it on the shared ledger of the network [into a memory for use by said first and said second means for maintaining] via each peer on the channel. Specifically, for each valid transaction, “the write sets are committed to current state database.”¹⁹ Once the block is committed to the shared ledger, it is immutably written into a memory that cannot be tampered with or changed.

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

81. In addition and/or in the alternative to its direct infringements, IBM has indirectly infringed one or more claims of the ‘696 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the Accused Products.

82. At a minimum, IBM has had knowledge of the ‘696 Patent based at least on its conduct before the United States Patent and Trademark Office (“USPTO”). For example, U.S. Patent Application Publication No. US2007/0061360 A1 (the publication of the ‘668 Patent) was

¹⁹ *Transaction Flow*, available at <https://hyperledger-fabric.readthedocs.io/en/release-1.4/txflow.html>.

cited by the Examiner during the prosecution of U.S. Patent Application Publication No. 2012/0150925 A1, entitled “Proactive Method for Improved Reliability for Sustained Persistence of Immutable Files in Storage Clouds” and assigned to IBM. In addition, IBM has constructive knowledge of the ‘696 Patent given Pardalis’ compliance with 35 U.S.C. § 287.

83. In addition, prior to this lawsuit being filed, Pardalis corresponded with IBM and agents of IBM related to the ‘696 Patent, the Common Point Authoring System for Tracking And Authenticating Objects in a Distribution Chain, U.S. pending continuation patent application #20040093501 (notice of allowance issued in July, 2006), and the fact that both the ‘696 Patent and application #20040093501 had been distinguished from an IBM patent (i.e., U.S. Patent No. 6,438,560).

84. Also, prior to this lawsuit being filed, Pardalis communicated with IBM and agents of IBM—Dr. Dean Martin and Dr. Pat Selinger (separately)—regarding Pardalis’ patented methods for protecting data ownership rights along complex supply chains.

85. Moreover, IBM has constructive knowledge of the ‘696 Patent given Pardalis’ compliance with 35 U.S.C. § 287. Moreover, IBM has initiated several platforms, such as IBM IP Advisor with Watson (“IPA”), which is a tool allowing users (and IBM) to “easily navigate complex documents and patents to identify relevant patents for possible infringement and show evidence about the results. By digesting and analyzing large amounts of data, sorting it for relevancy and enabling natural language processing of queries, IPA saves patent engineers, IP attorneys and inventors time, while increasing accuracy of results. IPA is a cognitive patent search platform that combines deep IP and patent knowledge with AI from Watson Discovery, News, Analytics and Knowledge Studio. It leverages natural language processing for analysis in addition to standard structured queries. IPA is Kubernetes-based for multi-cloud implementations. It is

currently on the IBM Public Cloud, and the security around the Watson collections and cloud access ensure that your proprietary data is secure. This solution is easily supported on other cloud solutions and supports multiple use cases.”²⁰ And several Pardalis patents cite to IBM patents as forward citations, such as U.S. Patent No. 6,438,560 (e.g., citations by the ‘696 Patent). Upon information and belief, IBM has knowledge of the ‘696 Patent through its creation and use of IBM IP Advisor with Watson.

86. And in another IBM project, IBM partnered with a company called IPwe to “begin representing patents as non-fungible tokens (NFTs) or digital assets by working with IBM (NYSE: IBM) to create the infrastructure for representing patents as NFTs and storing the records on a blockchain network.”²¹ “These NFTs will be stored and shared on the IPwe Platform, hosted on IBM Cloud and powered by IBM Blockchain. The IPwe Platform also enables the Global Patent Marketplace, which allows owners and other members of the patent ecosystem to engage and transact, buy, license, finance, sell, research and commercialize patents. IPwe, working with IBM, was the first to create a patent marketplace on the blockchain. The introduction of NFTs will only help accelerate the opportunity for IP, which has been notoriously difficult to manage, value and transact, to be treated as a liquid asset.” *Id.* IBM and IPwe also “[c]reated the Global Patent Registry (GPR) powered by AI and blockchain.”²² This project between IBM and IPE is described:

IPwe enlisted the help of IBM to create a unique suite of products to fit its needs. Working from the IBM Cloud®, the company combines IBM® Blockchain technology with multiple IBM Watson® AI solutions to increase visibility and flexibility within the complex patent market for both buyers and sellers. IPwe uses AI capabilities to make sense of the millions of patents circulating globally, each

averaging a minimum of 20 pages. By blending natural language processing (NLP), predictive analytics and machine learning from IBM Watson, IPwe can rapidly analyze patent information. It can then use the information to generate summaries and reports to help users identify lucrative opportunities while steering clear of potential commercial risks. “IPwe helps companies discover what it is they have and what their competitors have from an IP perspective at a lower cost, what are the risk factors associated with it, and what can they do to generate a higher return on those intangible assets,” says Spangenberg. “We’ve made it possible for companies to be transparent in transactional activity, whether it be a license or acquisition transaction.” Leveraging AI and blockchain allowed IPwe to build an automated and transparent Global Patent Registry (GPR). The GPR is the world’s first blockchain registry collecting current, active and historical patent records in a single, freely accessible registry. The technology helps remove the barriers to understanding the critical aspects of patent information. It allows for both record keeping of and smart contracts for an underlying asset.

Id.

87. Further, “IPwe is partnering with IBM to accelerate its mission to address the inefficiencies in the patent marketplace. IBM Cloud and IBM Blockchain teams are working closely with IPwe on a multi-year project to assist IPwe in its mission to deliver world class solutions to its enterprise, SME, university, law firms, research institutions and government customers, with a heavy emphasis on meeting the needs of financial, technology and risk management executives. In addition to giving patent owners tools that provide greater visibility, effective management, and ease of conducting transactions with patents, the IPwe Platform reduces costs for innovators, and creates commercial opportunities for those that wish to partner or engage in financial transactions. The IPwe Platform, is a comprehensive solution that helps patent owners better understand and manage their patent assets. The IPwe Platform enables patent owners to: Better understand your own patent portfolios — AI driven analytical tools identify commercially or financially interesting patents and evaluate relevance, importance, transactional value and other metrics that are easily understood. Understand your position and the IP-based competitive landscape with tools to compare the relative strengths of your portfolio with your

actual and potential competitors' IP positions. Evaluate and manage IP risk in ways that were simply not possible before, by proactively identifying sources of risk and utilizing mitigation strategies targeted to managing that risk on a far more cost-effective basis. Make it much simpler and less expensive to conduct all kinds of patent transactions, including acquisitions, licensing, sales, insurance, patent pooling and financings. With patent assets, security and privacy being paramount, the IPwe platform leverages smart contracts underpinned by blockchain running on IBM Cloud."²³ Upon information and belief, IBM has knowledge of the '696 Patent through its creation and participation in these projects with IPwe.

88. Upon information and belief, since at least the above-mentioned instances when IBM was on notice of the '696 Patent, IBM has actively induced the direct infringements of its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Such inducements have been committed with the knowledge, or with willful blindness to the fact, that the acts induced constitute infringement of the '696 Patent. Indeed, IBM intended to cause and took affirmative steps to induce infringement by, among other things, creating and disseminating advertisements and instructive materials that promote the infringing use of the Accused Products;²⁴ creating and/or maintaining established distribution channels for the Accused Products into and within the United States; manufacturing the Accused Products in conformity with U.S. laws and regulations; distributing or making available technical documentation supporting use of the Accused Products that promote their

features, specifications, and applications—including webinars, interactive sessions, white papers, brochures, and manuals;²⁵ providing developer tools for the Accused Products—including software development kits (SDKs) and application programming interfaces (APIs); testing and certifying blockchain features in the Accused Products; and by providing technical support, onboarding services, product updates, tutorials, training, and/or related services for these products to purchasers in the United States.²⁶

Damages

89. Pardalis has been damaged as a result of IBM’s infringing conduct described in this Count. IBM is, thus, liable to Pardalis in an amount that adequately compensates Pardalis for IBM’s infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

COUNT II

(INFRINGEMENT OF U.S. PATENT NO. 7,136,869)

90. Plaintiff incorporated the preceding paragraphs herein by reference.

91. This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, et seq.

²⁵See, e.g., *IBM Blockchain Platform: Technical Overview*, IBM (2022), available at <https://www.ibm.com/downloads/cas/Q9DGBLV7>; *Getting started with IBM Blockchain Platform*, IBM Documentation, available at <https://cloud.ibm.com/docs/blockchain>; Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 7 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>; *IBM Blockchain Platform Console Video Series*, IBM (last updated July 1, 2020), available at <https://developer.ibm.com/series/ibm-blockchain-platform-console-video-series/>.

²⁶See, e.g., *IBM Support for Hyperledger Fabric*, available at www.ibm.com/cloud/blockchain-platform/hyperledger-fabric-support; *Blockchain Tutorials*, IBM Developer, available at <https://developer.ibm.com/technologies/blockchain/tutorials/>; *IBM Blockchain 101: Quick-start guide for developers*, IBM Developer, available at <https://developer.ibm.com/tutorials/cl-ibm-blockchain-101-quick-start-guide-for-developers-bluemix-trs/>.

92. Pardalis is the owner of all substantial rights, title, and interest in and to the '869 Patent including the right to exclude others and to enforce, sue, and recover damages for past infringements.

93. The '869 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on November 14, 2006, after full and fair examination.

94. IBM has directly and/or indirectly infringed (by inducing infringement) one or more claims of the '869 Patent in this District and elsewhere in Texas and the United States by making, using, selling, offering to sell, and/or importing, and by actively inducing others to make, use, sell, offer to sell, and/or import, IBM products, their components and processes, and/or products containing the same that incorporate the fundamental technologies covered by the '869 Patent, including, but not limited to, the Accused Products.

Direct Infringement (35 U.S.C. § 271(a))

95. IBM has directly infringed one or more claims of the '869 Patent in this District and elsewhere in Texas and the United States.

96. IBM has directly infringed, either by itself or via its agent(s), at least claim 9 of the '869 Patent as set forth under 35 U.S.C. § 271(a) by making, offering to sell, selling, testing, and/or using the Accused Products.

97. By way of illustration only, the Accused Products perform each and every element of claim 9 of the '869 Patent. The Accused Products perform “a method for maintaining data for use by authoring and accessing members to track uniquely identified products.” For example, each Accused Product maintains a series of ordered and back-linked blocks within an append-only distributed system of records (i.e., a shared ledger) across a peer-to-peer network for permissioned clients and users [authoring and accessing members] to track uniquely identified assets [products].

On information and belief, permissioned users may use the unique transaction hash/transaction ID, associated with a specific transaction (e.g., specific product(s)) on the blockchain, for tracking purposes. For example, IBM’s Food Trust blockchain solution maintains data (e.g., food supply chain data) on a blockchain ledger to provide a permission-based, shared view of food ecosystem information for permissioned users to track uniquely identified food products. As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”²⁷ “Once data is uploaded [by a permissioned client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date.”²⁸

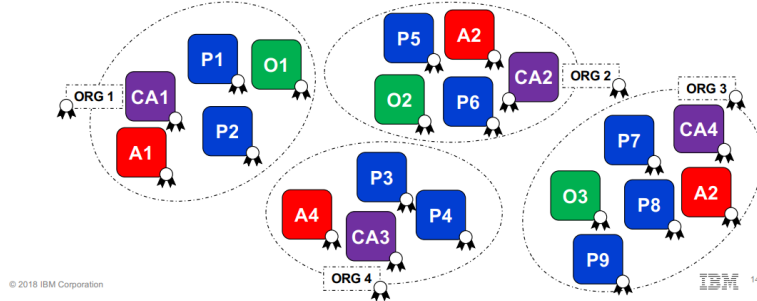

98. The Accused Products practice “enabling an authorized authoring member to create data comprising a draft informational object, which uniquely identifies a product for tracking purposes.” For example, each Accused Product enables a permissioned client [authorized authoring member], via one or more certificate authorities, to create an ordered transaction containing one or more endorsed transaction proposals [data comprising a draft informational object] that uniquely identifies an asset [product] for tracking purposes. Specifically, the Accused Products utilize one or more certificate authorities to generate unique identities for each permissioned client, which enables the use of policies to constrain network participation (e.g., to read and/or write the shared ledger) and access to transaction details, as shown below:

²⁷ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

²⁸ *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

The importance of identity

- Every actor has an associated X.509 identity issued by its organization's Certificate Authority
- A peer, orderer, application, organization, CA uses its identity to determine its organizational role
- This role determines the level of access an actor has to network resources, e.g. read/write the ledger

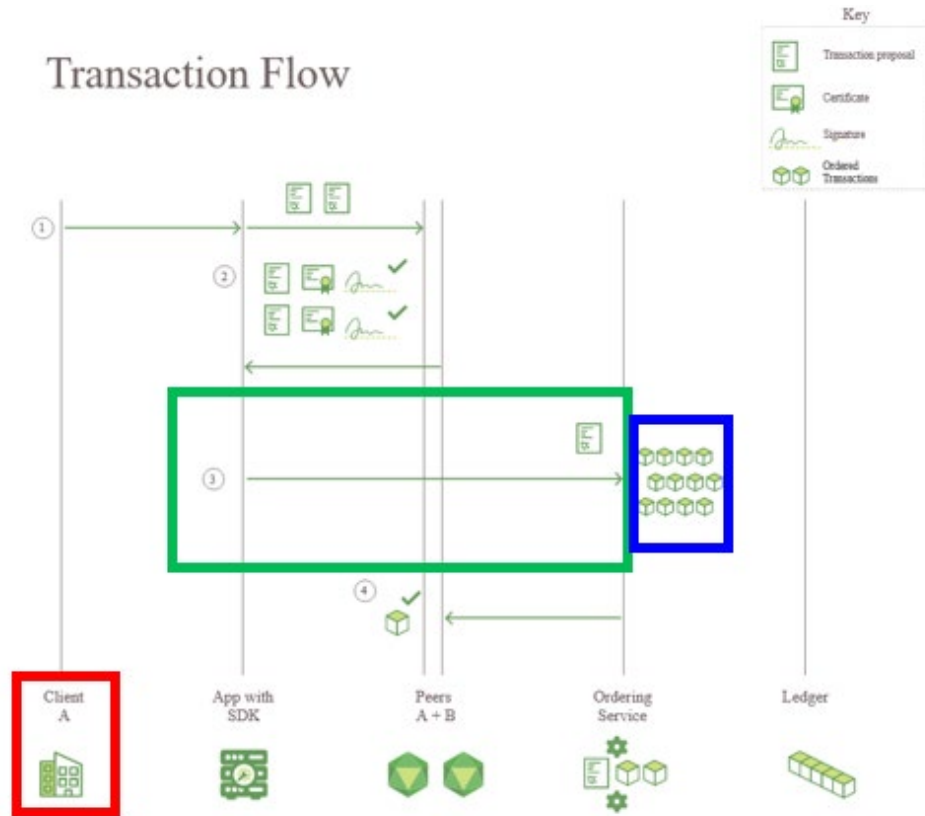

IBM Blockchain Platform: Technical Introduction, at p. 14 (2019, version 1.1).

99. When a client is authorized to write the ledger based on its unique identity [authorized authoring member], each Accused Product enables that permissioned client to create the ordered transaction containing one or more endorsed transaction proposals, as shown below:

Transaction Flow, available at <https://hyperledger-fabric.readthedocs.io/en/release-1.4/txflow.html> (emphasis added).

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

100. For example, IBM’s Food Trust blockchain solution enables a permitted client [authorized authoring member] to create an ordered transaction [draft informational object] that uniquely identifies a food product (e.g., by the product’s ID, name or the associated PO number) for tracking purposes. Specifically, IBM’s Food Trust solution “assigns predefined roles that grant users authorization to execute specific network tasks on behalf of their organization”²⁹ in order to “provide[] participants with a permission-based, shared view of food ecosystem information,

²⁹ *About IBM Food Trust* at p. 15, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

allowing convenient data publishing and controlled sharing of information.”³⁰ As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”³¹ “Once data is uploaded [by a permitted client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date,”³² as shown below:

The screenshot shows the 'Trace' interface for 'Whole Grain Margherita Pizza (1002007437118.88NA)'. The search criteria include a date range from 11/30/2018 to 12/04/2020 and Lot: 327. The interface displays the following results:

2 LOTS			2 PALLETS		4 SERIAL NUMBERS	
Lot numbers found	Expiration date	Production date	Pallet numbers found	Type in serial number		
<input type="checkbox"/> 324	04/03/2020	---	<input type="checkbox"/> LPN: 2116	<input type="checkbox"/> 6183	<input type="checkbox"/> 7183	
<input checked="" type="checkbox"/> 327	12/03/2020	---	<input type="checkbox"/> LPN: 3116	<input type="checkbox"/> 8183	<input type="checkbox"/> 9183	

A notification box indicates: 'Products found. Lots, pallets and/or serial numbers were found for the specified product and date range.'

IBM Food Trust: Trace, IBM,
available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

³⁰ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

³¹ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

³² *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

The screenshot shows the IBM Food Trust Trace interface for a specific product. At the top, the product name is 'Whole Grain Margherita Pizza (1002007637118.bkNA)' with a date range of 11/30/2018 - 12/04/2020 and lot number 327. The timeline shows a start date of October 5, 2020, and an end date of November 13, 2020. Below the timeline, the supply chain is displayed in a grid format. It includes categories such as Farm (5), Distribution Center (1), Supplier (1), Distributor (1), Manufacturer of Goods (1), and Store (1). Each category lists specific items like Basil, Organic Mozzarella Cheese, Whole Wheat Pizza Crust, Tomato Purée, and Whole Grain Margherita Pizza, along with their respective counts and roles in the supply chain.

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

This screenshot displays the IBM Food Trust Trace interface for 'Basil (1002007637118.pXyp)'. The date range is 01/19/2019 - 01/19/2021, and the lot number is 9087. The timeline indicates a start date of November 4, 2020, and an end date of November 13, 2020, with a specific focus on November 10 and 11. The supply chain view shows a Farm (1), a Manufacturer of Goods (1), and five Stores (5). The Manufacturer of Goods section lists 'Whole Grain Margherita Pizza' and 'Basil'. The Store section lists 'Whole Grain Margherita Pizza' and five individual pizza stores (Pizza Store #2 through #5).

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

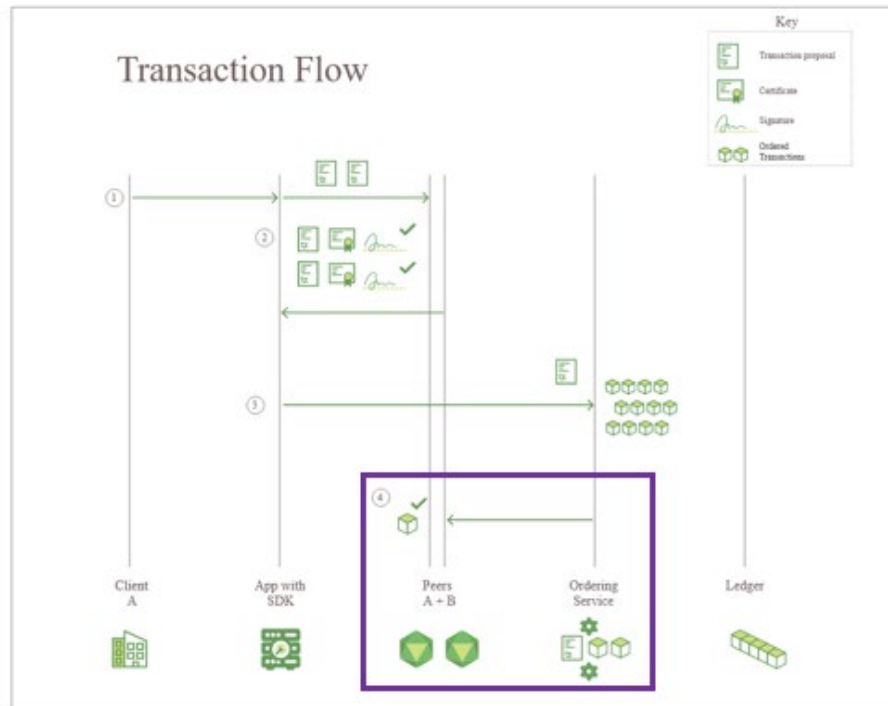

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

101. The Accused Products practice “authenticating said draft informational object created by said authorized authoring member.” For example, each Accused Product authenticates

each ordered transaction [draft informational object] via a consensus protocol. Specifically, each Accused Product distributes the ordered transaction from the ordering service to the channel peers on the network for validation, as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

102. During the validation process, each Accused Product employs a consensus protocol/mechanism to check the validity of each endorsed transaction proposal within the ordered transaction. As IBM explains, “[a] consensus protocol agreed to by all participating members of the business network ensures that the ledger is updated only with network-verified transactions.”³³ Therefore, the Accused Products authenticate as required by claim 9 of the ’869 Patent via the validation process.

³³ *Blockchain Basics: Introduction to Distributed Ledgers*, IBM (last updated June 1, 2019), available at <https://developer.ibm.com/tutorials/cl-blockchain-basics-intro-bluemix-trs>.

103. The Accused Products practice “converting said authenticated informational object created by said authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier.” For example, once the peers authenticate the ordered transaction via the aforementioned validation process [authenticated informational object], each Accused Product converts that ordered transaction into an immutable block [immutable informational object], which is identified by a block hash [unique identifier]. As IBM explains, “each block contains a hash (a digital fingerprint or unique identifier),”³⁴ as shown below:

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

104. The Accused Products practice “writing said created immutable informational object into a memory for use by authorized accessing members.” For example, each Accused Product appends [writes] each authenticated block [created immutable informational object] to the record (i.e., block) preceding it on the shared ledger of the network [into a memory] via each peer on the channel to become accessible [for use] to permissioned users [authorized accessing

³⁴ Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

members] (e.g., to access, inspect, or add to the data via the creation of a new block). Once the block is committed to the shared ledger, it is immutably written into a memory that cannot be tampered with or changed.

105. The Accused Products practice “updating an informational object by creating a new informational object relating back to said informational object and containing new data.” For example, each Accused Product updates a previously appended block [informational object] through the creation of an additional block [new informational object] and appending it to the shared ledger following the previous block, as shown below:

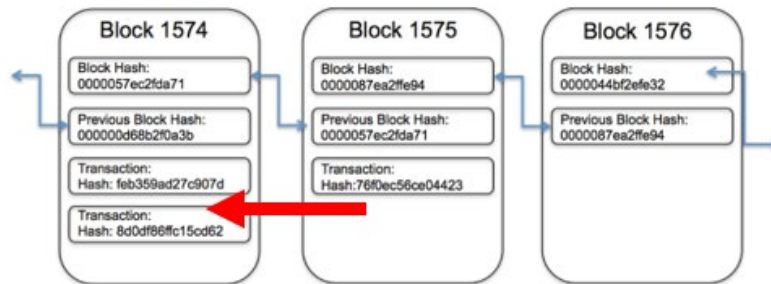

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

106. In doing so, the underlying data associated with a previous transaction is updated according to changes or introduction of new data, with the new or changed information of the additional block relating back to the previous block’s information. As IBM explains, “[i]f a transaction is in error, a new transaction must be used to reverse the error, and both transactions are then visible.”³⁵

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

³⁵ Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 7 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>.

107. In addition and/or in the alternative to its direct infringements, IBM has indirectly infringed one or more claims of the '869 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the Accused Products.

108. At a minimum, IBM has had knowledge of the '869 Patent based at least on its conduct before the United States Patent and Trademark Office ("USPTO"). For example, U.S. Patent Application Publication No. US2007/0061360 A1 (the publication of the '668 Patent) was cited by the Examiner during the prosecution of U.S. Patent Application Publication No. 2012/0150925 A1, entitled "Proactive Method for Improved Reliability for Sustained Persistence of Immutable Files in Storage Clouds" and assigned to IBM.

109. In addition, prior to this lawsuit being filed, Pardalis corresponded with IBM and agents of IBM related to the '696 Patent, the Common Point Authoring System for Tracking And Authenticating Objects in a Distribution Chain, U.S. pending continuation patent application #20040093501 (notice of allowance issued in July, 2006), and the fact that both the '696 Patent and application #20040093501 had been distinguished from an IBM patent (i.e., U.S. Patent No. 6,438,560).

110. Also, prior to this lawsuit being filed, Pardalis communicated with IBM and agents of IBM—Dr. Dean Martin and Dr. Pat Selinger (separately)—regarding Pardalis' patented methods for protecting data ownership rights along complex supply chains.

111. Moreover, IBM has constructive knowledge of the '869 Patent given Pardalis' compliance with 35 U.S.C. § 287. Moreover, IBM has initiated several platforms, such as IBM IP Advisor with Watson ("IPA"), which is a tool allowing users (and IBM) to "easily navigate

complex documents and patents to identify relevant patents for possible infringement and show evidence about the results. By digesting and analyzing large amounts of data, sorting it for relevancy and enabling natural language processing of queries, IPA saves patent engineers, IP attorneys and inventors time, while increasing accuracy of results. IPA is a cognitive patent search platform that combines deep IP and patent knowledge with AI from Watson Discovery, News, Analytics and Knowledge Studio. It leverages natural language processing for analysis in addition to standard structured queries. IPA is Kubernetes-based for multi-cloud implementations. It is currently on the IBM Public Cloud, and the security around the Watson collections and cloud access ensure that your proprietary data is secure. This solution is easily supported on other cloud solutions and supports multiple use cases.”³⁶ And several Pardalis patents cite to IBM patents as forward citations, such as U.S. Patent No. 6,438,560 (*e.g.*, citations by the ’869 Patent). Upon information and belief, IBM has knowledge of the ’869 Patent through its creation and use of IBM IP Advisor with Watson.

112. And in another IBM project, IBM partnered with a company called IPwe to “begin representing patents as non-fungible tokens (NFTs) or digital assets by working with IBM (NYSE: IBM) to create the infrastructure for representing patents as NFTs and storing the records on a blockchain network.”³⁷ “These NFTs will be stored and shared on the IPwe Platform, hosted on IBM Cloud and powered by IBM Blockchain. The IPwe Platform also enables the Global Patent Marketplace, which allows owners and other members of the patent ecosystem to engage and transact, buy, license, finance, sell, research and commercialize patents. IPwe, working with IBM,

³⁶ *IBM IP Advisor with Watson*, IBM (2020), available at <https://www.ibm.com/downloads/cas/YV9PMLEB>.

³⁷ IBM Newsroom, available at <https://newsroom.ibm.com/2021-04-20-IPwe-and-IBM-Seek-to-Transform-Corporate-Patents-With-Next-Generation-NFTs-Using-IBM-Blockchain>.

was the first to create a patent marketplace on the blockchain. The introduction of NFTs will only help accelerate the opportunity for IP, which has been notoriously difficult to manage, value and transact, to be treated as a liquid asset.” *Id.* IBM and IPwe also “[c]reated the Global Patent Registry (GPR) powered by AI and blockchain.”³⁸ This project between IBM and IPE is described:

IPwe enlisted the help of IBM to create a unique suite of products to fit its needs. Working from the IBM Cloud®, the company combines IBM® Blockchain technology with multiple IBM Watson® AI solutions to increase visibility and flexibility within the complex patent market for both buyers and sellers. IPwe uses AI capabilities to make sense of the millions of patents circulating globally, each averaging a minimum of 20 pages. By blending natural language processing (NLP), predictive analytics and machine learning from IBM Watson, IPwe can rapidly analyze patent information. It can then use the information to generate summaries and reports to help users identify lucrative opportunities while steering clear of potential commercial risks. “IPwe helps companies discover what it is they have and what their competitors have from an IP perspective at a lower cost, what are the risk factors associated with it, and what can they do to generate a higher return on those intangible assets,” says Spangenberg. “We’ve made it possible for companies to be transparent in transactional activity, whether it be a license or acquisition transaction.” Leveraging AI and blockchain allowed IPwe to build an automated and transparent Global Patent Registry (GPR). The GPR is the world’s first blockchain registry collecting current, active and historical patent records in a single, freely accessible registry. The technology helps remove the barriers to understanding the critical aspects of patent information. It allows for both record keeping of and smart contracts for an underlying asset.

management executives. In addition to giving patent owners tools that provide greater visibility, effective management, and ease of conducting transactions with patents, the IPwe Platform reduces costs for innovators, and creates commercial opportunities for those that wish to partner or engage in financial transactions. The IPwe Platform, is a comprehensive solution that helps patent owners better understand and manage their patent assets. The IPwe Platform enables patent owners to: Better understand your own patent portfolios — AI driven analytical tools identify commercially or financially interesting patents and evaluate relevance, importance, transactional value and other metrics that are easily understood. Understand your position and the IP-based competitive landscape with tools to compare the relative strengths of your portfolio with your actual and potential competitors' IP positions. Evaluate and manage IP risk in ways that were simply not possible before, by proactively identifying sources of risk and utilizing mitigation strategies targeted to managing that risk on a far more cost-effective basis. Make it much simpler and less expensive to conduct all kinds of patent transactions, including acquisitions, licensing, sales, insurance, patent pooling and financings. With patent assets, security and privacy being paramount, the IPwe platform leverages smart contracts underpinned by blockchain running on IBM Cloud.”³⁹ Upon information and belief, IBM has knowledge of the '869 Patent through its creation and participation in these projects with IPwe.

114. Upon information and belief, since at least the above-mentioned instances when IBM was on notice of the '869 Patent, IBM has actively induced the direct infringements of its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Such inducements have been committed with the knowledge, or with willful blindness to the fact, that the acts induced constitute infringement of

³⁹ See e.g., <https://www.ibm.com/blog/disrupting-the-patent-ecosystem-with-blockchain-and-ai/>.

the '869 Patent. Indeed, IBM intended to cause and took affirmative steps to induce infringement by, among other things, creating and disseminating advertisements and instructive materials that promote the infringing use of the Accused Products;⁴⁰ creating and/or maintaining established distribution channels for the Accused Products into and within the United States; manufacturing the Accused Products in conformity with U.S. laws and regulations; distributing or making available technical documentation supporting use of the Accused Products that promote their features, specifications, and applications—including webinars, interactive sessions, white papers, brochures, and manuals;⁴¹ providing developer tools for the Accused Products—including software development kits (SDKs) and application programming interfaces (APIs); testing and certifying blockchain features in the Accused Products; and by providing technical support, onboarding services, product updates, tutorials, training, and/or related services for these products to purchasers in the United States.⁴²

Damages

115. Pardalis has been damaged as a result of IBM's infringing conduct described in this Count. IBM is, thus, liable to Pardalis in an amount that adequately compensates Pardalis for IBM's infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

COUNT III

(INFRINGEMENT OF U.S. PATENT NO. 7,949,668)

116. Plaintiff incorporates the preceding paragraphs herein by reference.

117. This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, *et seq.*

118. Pardalis is the owner of all substantial rights, title, and interest in and to the '668 Patent including the right to exclude others and to enforce, sue, and recover damages for past infringements.

119. The '668 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on May 24, 2011, after full and fair examination.

120. IBM has directly and/or indirectly infringed (by inducing infringement) one or more claims of the '668 Patent in this District and elsewhere in Texas and the United States by making, using, selling, offering to sell, and/or importing, and by actively inducing others to make, use, sell, offer to sell, and/or import, IBM products, their components and processes, and/or products containing the same that incorporate the fundamental technologies covered by the '668 Patent, including, but not limited to, the Accused Products.

Direct Infringement (35 U.S.C. § 271(a))

121. IBM has directly infringed one or more claims of the '668 Patent in this District and elsewhere in Texas and the United States.

122. IBM has directly infringed, either by itself or via its agent(s), at least claim 7 of the '668 Patent as set forth under 35 U.S.C. § 271(a) by making, offering to sell, selling, testing, and/or using the Accused Products.

123. By way of illustration only, the Accused Products perform each and every element of claim 7 of the '668 Patent. The Accused Products perform “a method of operating a common point authoring system for complex sharing of hierarchically authored data objects in a distribution chain.” For example, each Accused Product operates a common point authoring system for sharing a series of ordered and back-linked blocks [distribution chain] that are each authored by a permitted client within an append-only distributed system of records (i.e., a shared ledger) across a peer-to-peer network, as shown below:

FIGURE 1-1: Business networks before and after blockchain.

Manav Gupta, *Blockchain for Dummies: IBM Limited Edition*, at p. 7 (2017).

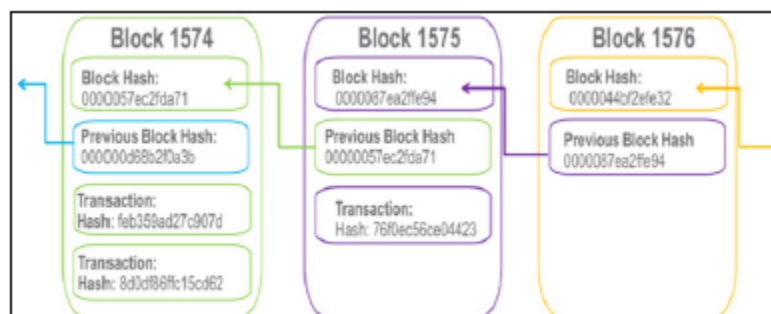

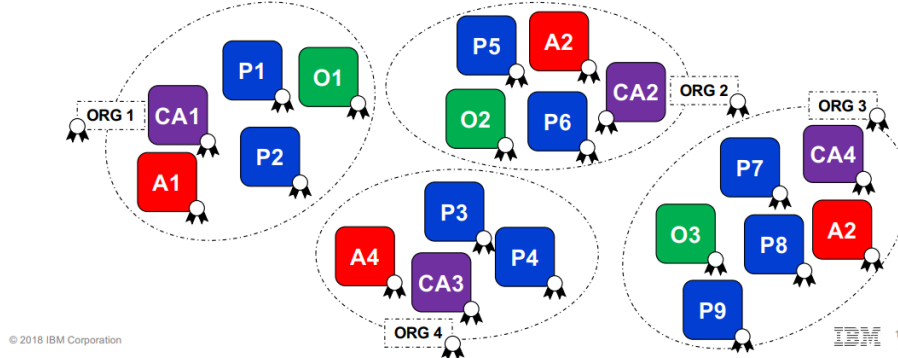

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: IBM Limited Edition*, at p. 14 (2017).

124. The Accused Products practice “enabling an authorized authoring member to create data comprising a draft informational object, which uniquely identifies a product for tracking purposes.” For example, each Accused Product enables a permissioned client [authorized authoring member], via one or more certificate authorities, to create an ordered transaction containing one or more endorsed transaction proposals [data comprising a draft informational object] that uniquely identifies an asset [product] for tracking purposes. Specifically, the Accused Products utilize one or more certificate authorities to generate unique identities for each permissioned client, which enables the use of policies to constrain network participation (e.g., to read and/or write the shared ledger) and access to transaction details, as shown below:

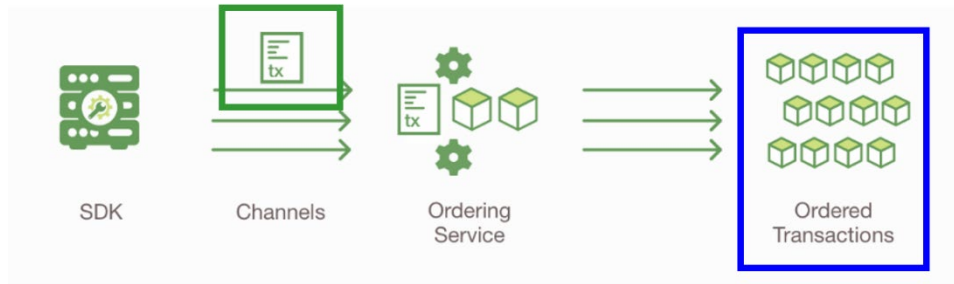

The importance of identity

- Every **actor** has an associated X.509 **identity** issued by its organization's **Certificate Authority**
- A **peer, orderer, application, organization, CA** uses its identity to determine its **organizational role**
- This **role determines** the level of **access** an actor has to network resources, e.g. read/write the ledger

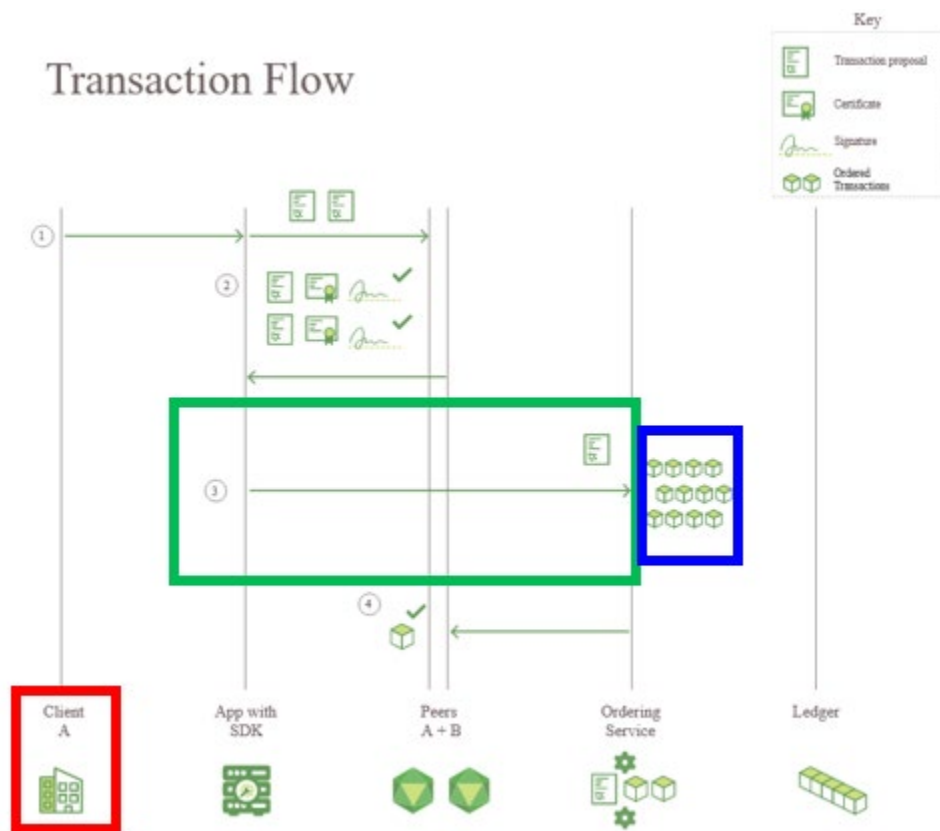

IBM Blockchain Platform: Technical Introduction, at p. 14 (2019, version 1.1).

125. When a client is authorized to write the ledger based on its unique identity [authorized authoring member], each Accused Product enables that permissioned client to create the ordered transaction containing one or more endorsed transaction proposals, as shown below:

Transaction Flow, available at <https://hyperledger-fabric.readthedocs.io/en/release-1.4/txflow.html> (emphasis added).

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

126. For example, IBM’s Food Trust blockchain solution enables a permitted client [authorized authoring member] to create an ordered transaction [draft informational object] that uniquely identifies a food product (e.g., by the product’s ID, name or the associated PO number)

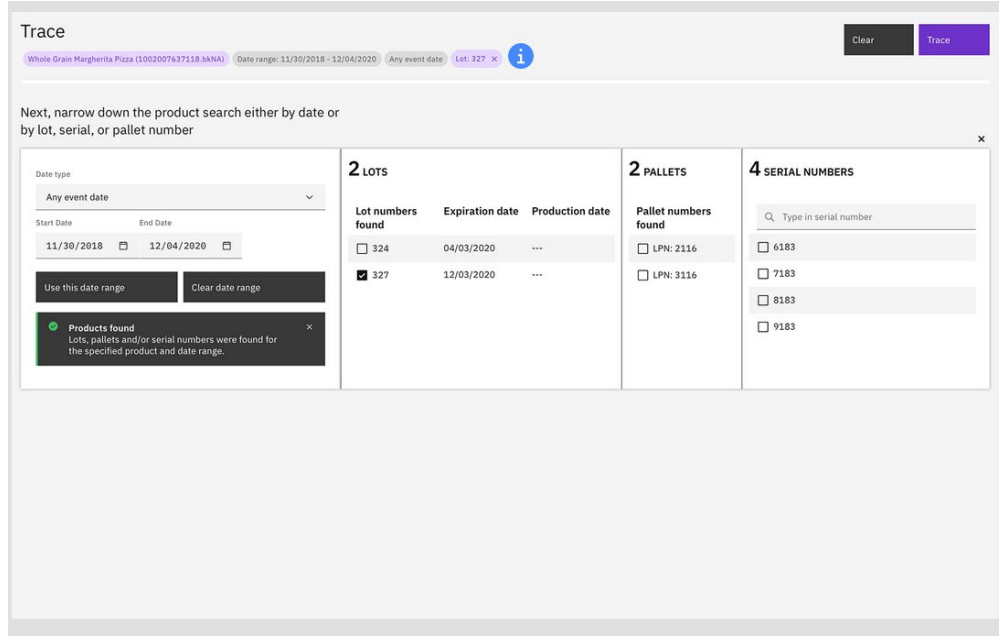

for tracking purposes. Specifically, IBM’s Food Trust solution “assigns predefined roles that grant users authorization to execute specific network tasks on behalf of their organization”⁴³ in order to “provide[] participants with a permission-based, shared view of food ecosystem information, allowing convenient data publishing and controlled sharing of information.”⁴⁴ As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”⁴⁵ “Once data is uploaded [by a permissioned client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date,”⁴⁶ as shown below:

⁴³ *About IBM Food Trust* at p. 15, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

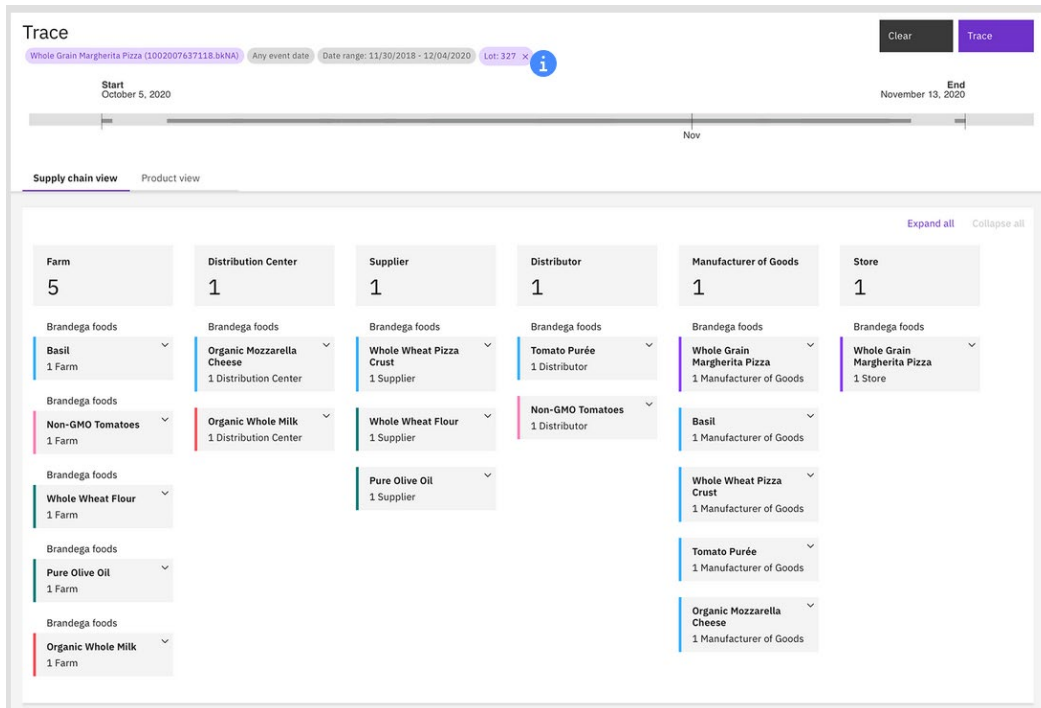

⁴⁴ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

⁴⁵ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

⁴⁶ *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

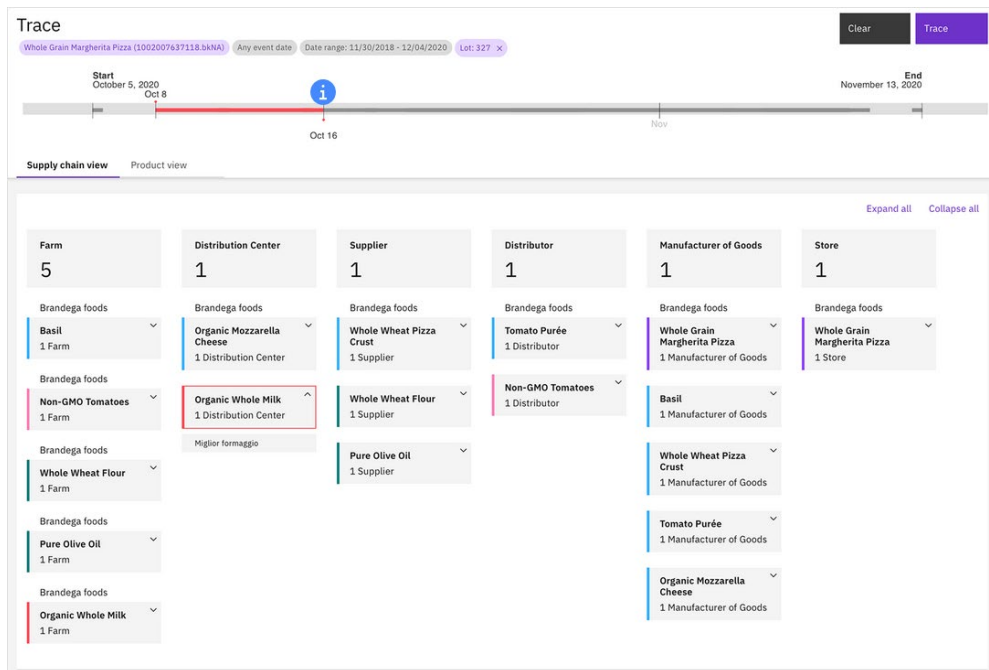

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

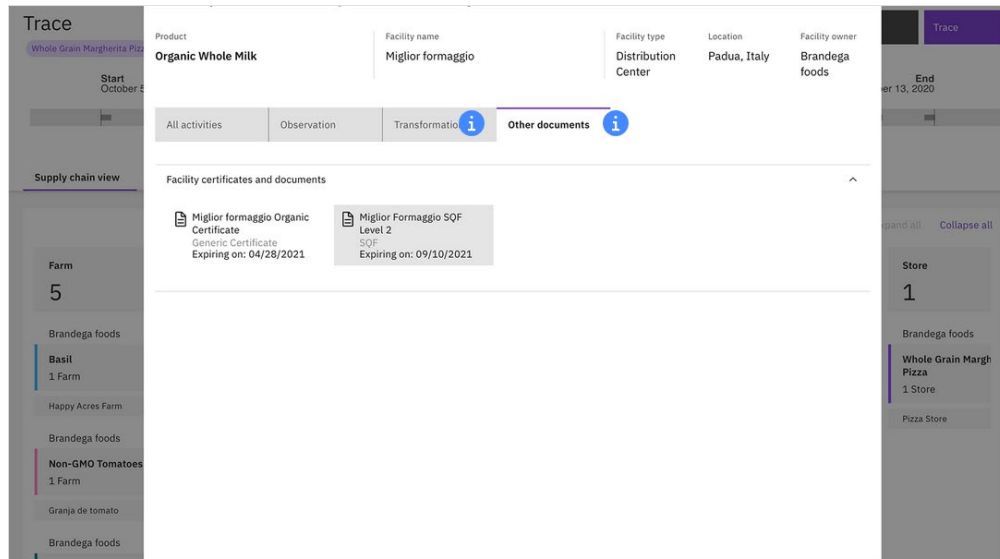

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

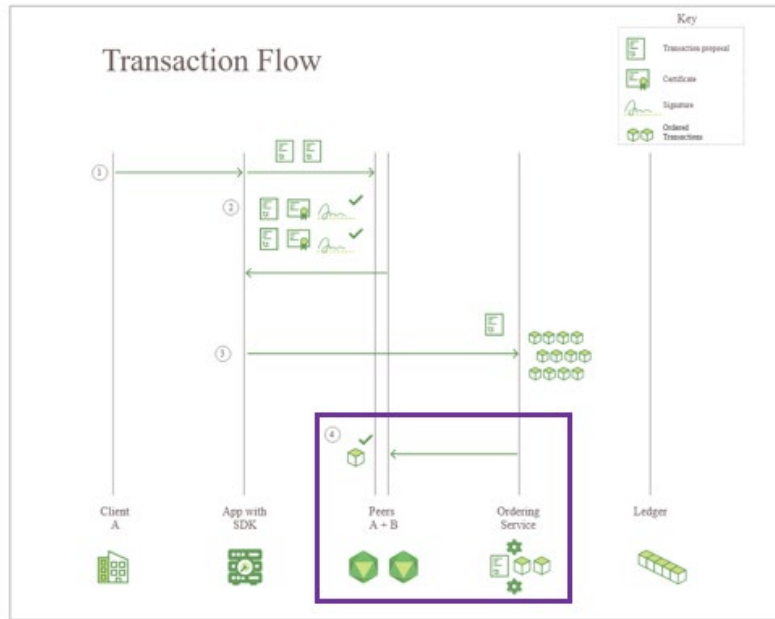

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

127. The Accused Products practice “enabling an authorized individual to authenticate said draft informational object created by said authorized authoring member.” For example, each Accused Product enables a permissioned peer [authorized individual], to authenticate the ordered transaction via a consensus protocol. Specifically, each Accused Product distributes the ordered transaction containing one or more endorsed transaction proposals from the ordering service to the channel peers on the network for validation, as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

128. During the validation process, each Accused Product employs a consensus protocol/mechanism to check the validity of each endorsed transaction proposal within the ordered transaction. As IBM explains, “[a] consensus protocol agreed to by all participating members of the business network ensures that the ledger is updated only with network-verified transactions.”⁴⁷ Therefore, the Accused Products authenticate as required by claim 7 via the validation process.

129. The Accused Products practice “converting said authenticated informational object created by said authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier.” For example, once the peers authenticate the ordered transaction via the aforementioned validation process [authenticated informational object], each Accused Product converts that ordered transaction into an immutable block [immutable

⁴⁷ *Blockchain Basics: Introduction to Distributed Ledgers*, IBM (last updated June 1, 2019), available at <https://developer.ibm.com/tutorials/cl-blockchain-basics-intro-bluemix-trs>.

informational object], which is identified by a block hash [unique identifier]. As IBM explains, “each block contains a hash (a digital fingerprint or unique identifier),”⁴⁸ as shown below:

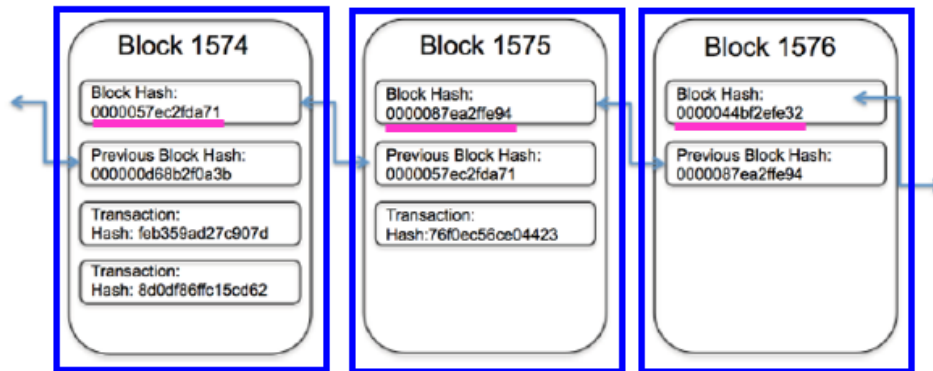

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

130. The Accused Products practice “writing said created immutable informational object into a memory for use by authorized accessing members.” For example, each Accused Product appends [writes] each authenticated block [created immutable informational object] to the record (i.e., block) preceding it on the shared ledger of the network [into a memory] via each peer on the channel to become accessible [for use] to permissioned users [authorized accessing members] (e.g., to access, inspect, or add to the data via the creation of a new block). Once the block is committed to the shared ledger, it is immutably written into a memory that cannot be tampered with or changed.

131. The Accused Products practice “enabling an authorized authoring member to create data comprising at least one draft data element.” For example, each Accused Product enables a permissioned client [authorized authoring member], via one or more certificate authorities, to

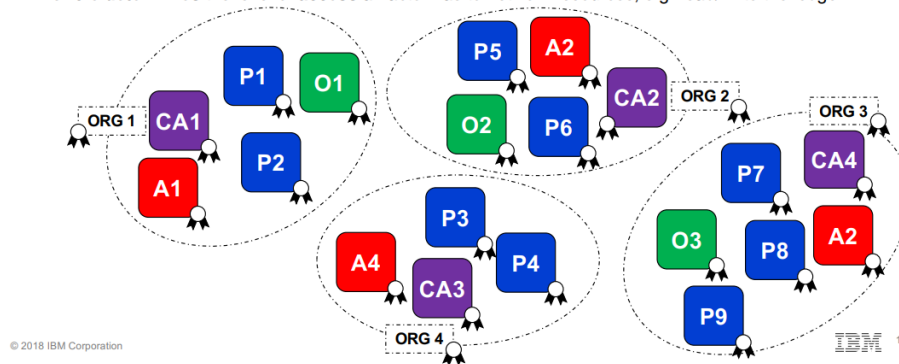

⁴⁸ Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>.

create one or more transaction proposals [data comprising at least one draft data element]. Specifically, the Accused Products utilize certificate authorities to generate unique identities for each permissioned client, which enables the use of policies to constrain network participation (e.g., to read and/or write the shared ledger) and access to transaction details, as shown below:

The importance of identity

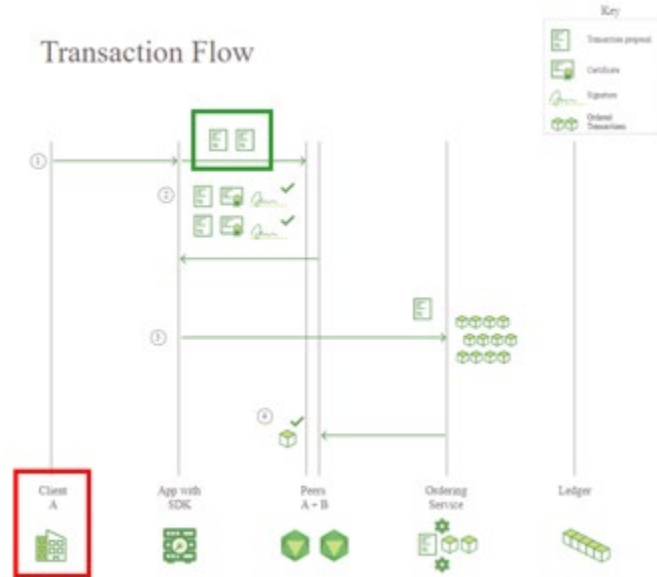

- Every **actor** has an associated X.509 **identity** issued by its organization's **Certificate Authority**
- A **peer, orderer, application, organization, CA** uses its identity to determine its **organizational role**
- This **role determines** the level of **access** an actor has to network resources, e.g. read/write the ledger

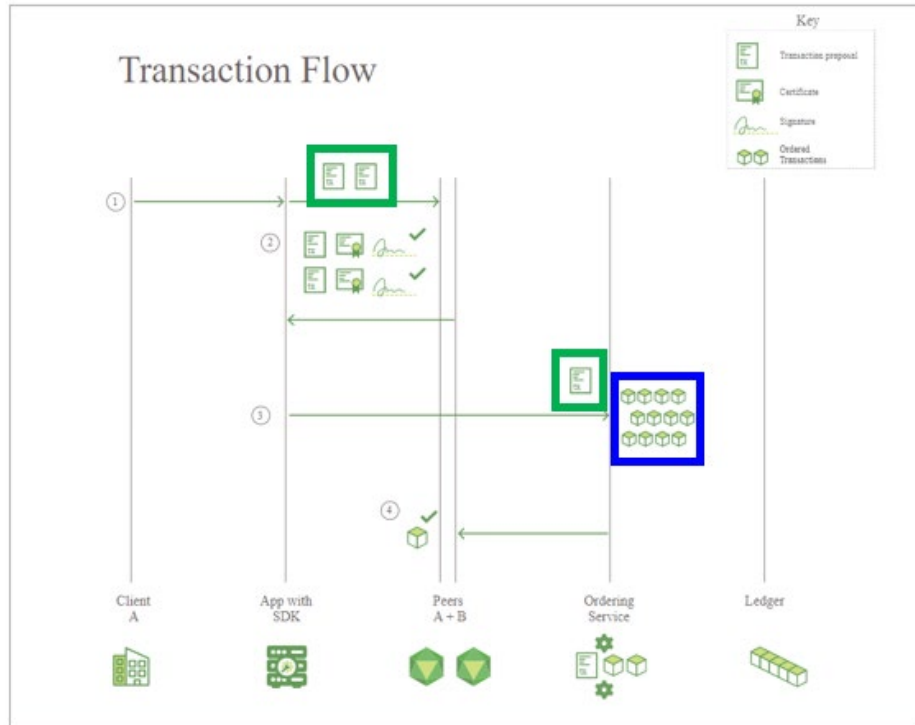

IBM Blockchain Platform: Technical Introduction, at p. 14 (2019, version 1.1).

132. When a client is authorized to write the ledger based on its unique identity [authorized authoring member], each Accused Product enables that permissioned client to create one or more transaction proposals [data comprising at least one draft data element], as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

133. The Accused Products practice the element of “wherein said step of enabling an authorized authoring member incorporates said at least one draft data element into said draft informational object.” For example, as demonstrated below, each Accused Product enables a permissioned client to create one or more transaction proposals [draft data element] (illustrated below in green) that are incorporated into an ordered transaction [draft informational object] (illustrated below in blue):

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

134. The Accused Products practice the element of “wherein said step of enabling an authorized individual to authenticate comprises: enabling an authorized individual to authenticate said draft data element created by said authorized authoring member.” For example, each Accused Product enables a permissioned peer [authorized individual] to verify and sign [authenticate] each transaction proposal [draft data element] created by the permissioned client [authorized authoring member] via an endorsement mechanism, as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

135. During the endorsement process, each Accused Product employs an endorsement mechanism that enables each permissioned peer [authorized individual] to verify the signature of each received transaction proposal and to simulate the execution of the input transaction against a smart contract. As IBM explains, the endorsement mechanism “is an important part of the network consensus algorithm in the IBM Blockchain Platform.”⁴⁹ Therefore, the Accused Products enable such authentication as required by claim 7 of the ’668 Patent via the endorsement process.

136. The Accused Products practice the element of “wherein said step of converting converts said authenticated at least one draft data element to a corresponding immutable draft data element which is identified by a unique identifier.” For example, each Accused Product converts each endorsed transaction proposal [authenticated draft data element], via an ordering service, into

⁴⁹ David Gorman, *Introduction to the endorsement of transactions in a business network*, IBM Developer (2018), available at <https://developer.ibm.com/articles/an-introduction-to-the-endorsement-of-transactions-in-a-business-network/>.

an ordered transaction containing the endorsed transaction proposals [immutable draft data element], as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

137. In addition and/or in the alternative to its direct infringements, IBM has indirectly infringed one or more claims of the '668 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the Accused Products.

138. At a minimum, IBM has had knowledge of the '668 Patent based at least on its conduct before the United States Patent and Trademark Office ("USPTO"). For example, U.S. Patent Application Publication No. US2007/0061360 A1 (the publication of the '668 Patent) was cited by the Examiner during the prosecution of U.S. Patent Application Publication No. 2012/0150925 A1, entitled "Proactive Method for Improved Reliability for Sustained Persistence

of Immutable Files in Storage Clouds” and assigned to IBM. In addition, IBM has constructive knowledge of the ’668 Patent given Pardalis’ compliance with 35 U.S.C. § 287.

139. In addition, prior to this lawsuit being filed, Pardalis corresponded with IBM and agents of IBM related to the ’696 Patent, the Common Point Authoring System for Tracking And Authenticating Objects in a Distribution Chain, U.S. pending continuation patent application #20040093501 (notice of allowance issued in July, 2006), and the fact that both the ’696 Patent and application #20040093501 had been distinguished from an IBM patent (i.e., U.S. Patent No. 6,438,560).

140. Also, prior to this lawsuit being filed, Pardalis communicated with IBM and agents of IBM—Dr. Dean Martin and Dr. Pat Selinger (separately)—regarding Pardalis’ patented methods for protecting data ownership rights along complex supply chains.

141. Moreover, IBM has constructive knowledge of the ’668 Patent given Pardalis’ compliance with 35 U.S.C. § 287. Moreover, IBM has initiated several platforms, such as IBM IP Advisor with Watson (“IPA”), which is a tool allowing users (and IBM) to “easily navigate complex documents and patents to identify relevant patents for possible infringement and show evidence about the results. By digesting and analyzing large amounts of data, sorting it for relevancy and enabling natural language processing of queries, IPA saves patent engineers, IP attorneys and inventors time, while increasing accuracy of results. IPA is a cognitive patent search platform that combines deep IP and patent knowledge with AI from Watson Discovery, News, Analytics and Knowledge Studio. It leverages natural language processing for analysis in addition to standard structured queries. IPA is Kubernetes-based for multi-cloud implementations. It is currently on the IBM Public Cloud, and the security around the Watson collections and cloud access ensure that your proprietary data is secure. This solution is easily supported on other cloud

solutions and supports multiple use cases.”⁵⁰ And several Pardalis patents cite to IBM patents as forward citations, such as U.S. Patent No. 6,438,560 (*e.g.*, citations by the ’696 Patent). Upon information and belief, IBM has knowledge of the ’668 Patent through its creation and use of IBM IP Advisor with Watson.

142. And in another IBM project, IBM partnered with a company called IPwe to “begin representing patents as non-fungible tokens (NFTs) or digital assets by working with IBM (NYSE: IBM) to create the infrastructure for representing patents as NFTs and storing the records on a blockchain network.”⁵¹ “These NFTs will be stored and shared on the IPwe Platform, hosted on IBM Cloud and powered by IBM Blockchain. The IPwe Platform also enables the Global Patent Marketplace, which allows owners and other members of the patent ecosystem to engage and transact, buy, license, finance, sell, research and commercialize patents. IPwe, working with IBM, was the first to create a patent marketplace on the blockchain. The introduction of NFTs will only help accelerate the opportunity for IP, which has been notoriously difficult to manage, value and transact, to be treated as a liquid asset.” *Id.* IBM and IPwe also “[c]reated the Global Patent Registry (GPR) powered by AI and blockchain.”⁵² This project between IBM and IPE is described:

IPwe enlisted the help of IBM to create a unique suite of products to fit its needs. Working from the IBM Cloud®, the company combines IBM® Blockchain technology with multiple IBM Watson® AI solutions to increase visibility and flexibility within the complex patent market for both buyers and sellers. IPwe uses AI capabilities to make sense of the millions of patents circulating globally, each averaging a minimum of 20 pages. By blending natural language processing (NLP), predictive analytics and machine learning from IBM Watson, IPwe can rapidly analyze patent information. It can then use the information to generate summaries and reports to help users identify lucrative opportunities while steering clear of

⁵⁰ *IBM IP Advisor with Watson*, IBM (2020), available at <https://www.ibm.com/downloads/cas/YV9PMLEB>.

⁵¹ IBM Newsroom, available at <https://newsroom.ibm.com/2021-04-20-IPwe-and-IBM-Seek-to-Transform-Corporate-Patents-With-Next-Generation-NFTs-Using-IBM-Blockchain>.

⁵² *AI and Blockchain help discover and transact IP*, IBM (2021), available at <https://www.ibm.com/case-studies/ipwe/>.

potential commercial risks. “IPwe helps companies discover what it is they have and what their competitors have from an IP perspective at a lower cost, what are the risk factors associated with it, and what can they do to generate a higher return on those intangible assets,” says Spangenberg. “We’ve made it possible for companies to be transparent in transactional activity, whether it be a license or acquisition transaction.” Leveraging AI and blockchain allowed IPwe to build an automated and transparent Global Patent Registry (GPR). The GPR is the world’s first blockchain registry collecting current, active and historical patent records in a single, freely accessible registry. The technology helps remove the barriers to understanding the critical aspects of patent information. It allows for both record keeping of and smart contracts for an underlying asset.

Id.

143. Further, “IPwe is partnering with IBM to accelerate its mission to address the inefficiencies in the patent marketplace. IBM Cloud and IBM Blockchain teams are working closely with IPwe on a multi-year project to assist IPwe in its mission to deliver world class solutions to its enterprise, SME, university, law firms, research institutions and government customers, with a heavy emphasis on meeting the needs of financial, technology and risk management executives. In addition to giving patent owners tools that provide greater visibility, effective management, and ease of conducting transactions with patents, the IPwe Platform reduces costs for innovators, and creates commercial opportunities for those that wish to partner or engage in financial transactions. The IPwe Platform, is a comprehensive solution that helps patent owners better understand and manage their patent assets. The IPwe Platform enables patent owners to: Better understand your own patent portfolios — AI driven analytical tools identify commercially or financially interesting patents and evaluate relevance, importance, transactional value and other metrics that are easily understood. Understand your position and the IP-based competitive landscape with tools to compare the relative strengths of your portfolio with your actual and potential competitors’ IP positions. Evaluate and manage IP risk in ways that were simply not possible before, by proactively identifying sources of risk and utilizing mitigation strategies targeted to managing that risk on a far more cost-effective basis. Make it much simpler

and less expensive to conduct all kinds of patent transactions, including acquisitions, licensing, sales, insurance, patent pooling and financings. With patent assets, security and privacy being paramount, the IPwe platform leverages smart contracts underpinned by blockchain running on IBM Cloud.”⁵³ Upon information and belief, IBM has knowledge of the ’668 Patent through its creation and participation in these projects with IPwe.

144. Upon information and belief, since at least the above-mentioned instances when IBM was on notice of the ’668 Patent, IBM has actively induced the direct infringements of its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Such inducements have been committed with the knowledge, or with willful blindness to the fact, that the acts induced constitute infringement of the ’668 Patent. Indeed, IBM intended to cause and took affirmative steps to induce infringement by, among other things, creating and disseminating advertisements and instructive materials that promote the infringing use of the Accused Products;⁵⁴ creating and/or maintaining established distribution channels for the Accused Products into and within the United States; manufacturing the Accused Products in conformity with U.S. laws and regulations; distributing or making available technical documentation supporting use of the Accused Products that promote their features, specifications, and applications—including webinars, interactive sessions, white papers, brochures, and manuals;⁵⁵ providing developer tools for the Accused Products—including

⁵³ See e.g., <https://www.ibm.com/blog/disrupting-the-patent-ecosystem-with-blockchain-and-ai/>

software development kits (SDKs) and application programming interfaces (APIs); testing and certifying blockchain features in the Accused Products; and by providing technical support, onboarding services, product updates, tutorials, training, and/or related services for these products to purchasers in the United States.⁵⁶

Damages

145. Pardalis has been damaged as a result of IBM's infringing conduct described in this Count. IBM is, thus, liable to Pardalis in an amount that adequately compensates Pardalis for IBM's infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

COUNT IV

(INFRINGEMENT OF U.S. PATENT NO. 8,307,000)

146. Plaintiff incorporates the preceding paragraphs herein by reference.

147. This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, *et seq.*

148. Pardalis is the owner of all substantial rights, title, and interest in and to the '000 Patent including the right to exclude others and to enforce, sue, and recover damages for past infringements.

Platform, IBM Documentation, available at <https://cloud.ibm.com/docs/blockchain>; Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 7 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>; *IBM Blockchain Platform Console Video Series*, IBM (last updated July 1, 2020), available at <https://developer.ibm.com/series/ibm-blockchain-platform-console-video-series/>.

⁵⁶ See., e.g., *IBM Support for Hyperledger Fabric*, available at www.ibm.com/cloud/blockchain-platform/hyperledger-fabric-support; *Blockchain Tutorials*, IBM Developer, available at <https://developer.ibm.com/technologies/blockchain/tutorials/>; *IBM Blockchain 101: Quick-start guide for developers*, IBM Developer, available at <https://developer.ibm.com/tutorials/cl-ibm-blockchain-101-quick-start-guide-for-developers-bluemix-trs/>.

149. The '000 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on November 6, 2011, after full and fair examination.

150. IBM has directly and/or indirectly infringed (by inducing infringement) one or more claims of the '000 Patent in this District and elsewhere in Texas and the United States by making, using, selling, offering to sell, and/or importing, and by actively inducing others to make, use, sell, offer to sell, and/or import, IBM products, their components and processes, and/or products containing the same that incorporate the fundamental technologies covered by the '000 Patent, including, but not limited to, the Accused Products.

Direct Infringement (35 U.S.C. § 271(a))

151. IBM has directly infringed one or more claims of the '000 Patent in this District and elsewhere in Texas and the United States.

152. IBM has directly infringed, either by itself or via its agent(s), at least claim 1 of the '000 Patent as set forth under 35 U.S.C. § 271(a) by making, offering to sell, selling, testing, and/or using the Accused Products.

153. By way of illustration only, the Accused Products perform each and every element of claim 1 of the '000 Patent. The Accused Products perform “a method for maintaining data for use by authoring and accessing members to track uniquely identified products.” For example, each Accused Product maintains a series of ordered and back-linked blocks within an append-only distributed system of records (i.e., a shared ledger) across a peer-to-peer network for permissioned clients and users [authoring and accessing members] to track uniquely identified assets [products]. On information and belief, permissioned users may use the unique transaction hash/transaction ID, associated with a specific transaction (e.g., specific product(s)) on the blockchain, for tracking purposes. For example, IBM's Food Trust blockchain solution maintains data (e.g., food supply

chain data) on a blockchain ledger to provide a permission-based, shared view of food ecosystem information for permissioned users to track uniquely identified food products. As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”⁵⁷ “Once data is uploaded [by a permissioned client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date.”⁵⁸

154. The Accused Products practice “enabling an authorized authoring member to create data comprising a draft informational object, which uniquely identifies a product for tracking purposes.” For example, each Accused Product enables a permissioned client [authorized authoring member], via one or more certificate authorities, to create an ordered transaction containing one or more endorsed transaction proposals [data comprising a draft informational object] that uniquely identifies an asset [product] for tracking purposes. Specifically, the Accused Products utilize one or more certificate authorities to generate unique identities for each permissioned client, which enables the use of policies to constrain network participation (e.g., to read and/or write the shared ledger) and access to transaction details, as shown below:

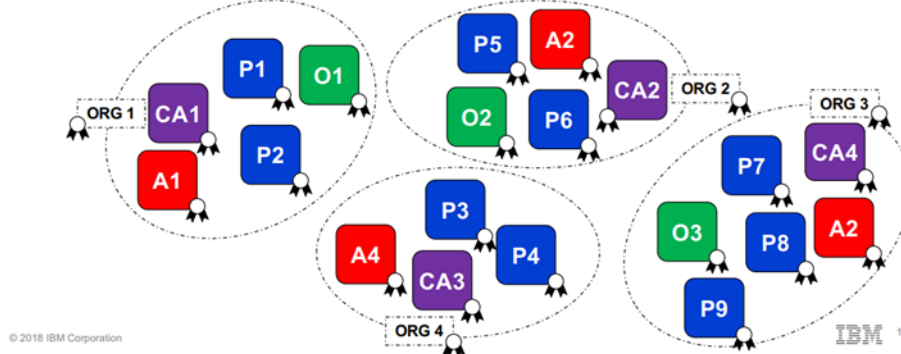

⁵⁷ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

⁵⁸ *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

The importance of identity

- Every actor has an associated X.509 identity issued by its organization's Certificate Authority
- A peer, orderer, application, organization, CA uses its identity to determine its organizational role
- This role determines the level of access an actor has to network resources, e.g. read/write the ledger

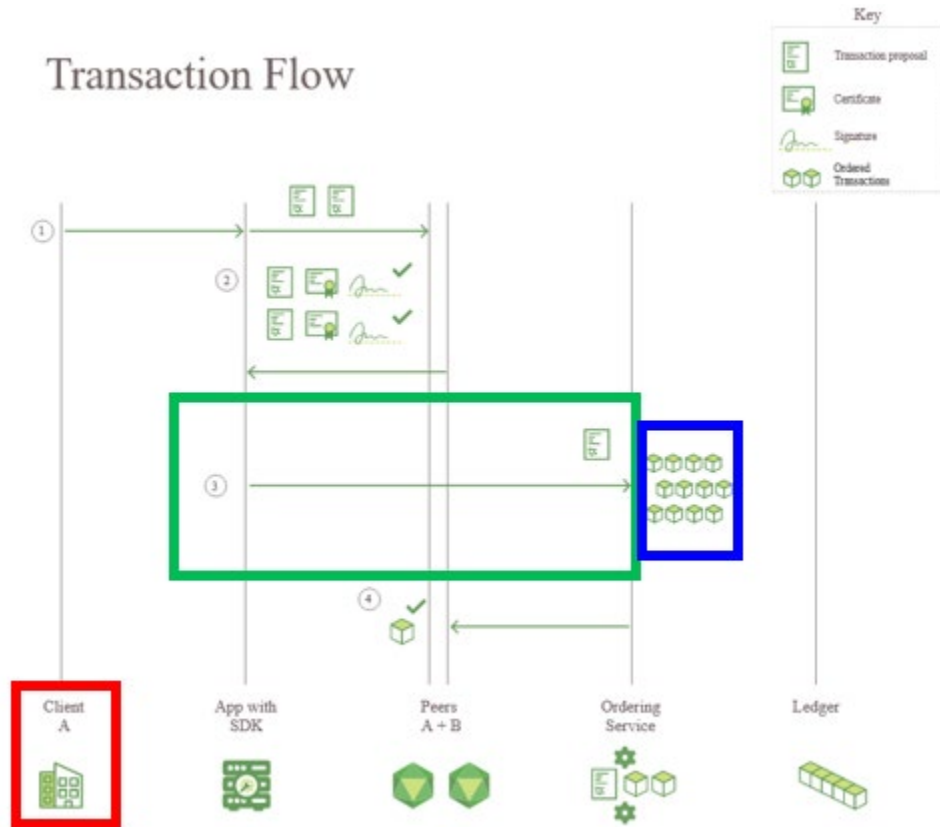

IBM Blockchain Platform: Technical Introduction, at p. 14 (2019, version 1.1).

155. When a client is authorized to write the ledger based on its unique identity [authorized authoring member], each Accused Product enables that permissioned client to create the ordered transaction containing one or more endorsed transaction proposals, as shown below:

Transaction Flow, available at <https://hyperledger-fabric.readthedocs.io/en/release-1.4/txflow.html> (emphasis added).

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

156. For example, IBM’s Food Trust blockchain solution enables a permissioned client [authorized authoring member] to create an ordered transaction [data comprising a draft informational object] that uniquely identifies a food product (e.g., by the product’s ID, name or the associated PO number) for tracking purposes. Specifically, IBM’s Food Trust solution “assigns predefined roles that grant users authorization to execute specific network tasks on behalf of their organization”⁵⁹ in order to “provide[] participants with a permission-based, shared view of food ecosystem information, allowing convenient data publishing and controlled sharing of

⁵⁹ *About IBM Food Trust* at p. 15, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

information.”⁶⁰ As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”⁶¹ “Once data is uploaded [by a permissioned client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date,”⁶² as shown below:

The screenshot displays the 'Trace' interface for 'Whole Grain Margherita Pizza (1002007637118 84NA)'. The search parameters are set to 'Any event date' with a date range from 11/30/2018 to 12/04/2020 and 'Lot: 327'. The interface shows the following results:

2 LOTS			2 PALLETS		4 SERIAL NUMBERS	
Lot numbers found	Expiration date	Production date	Pallet numbers found	Type in serial number		
<input type="checkbox"/> 324	04/03/2020	---	<input type="checkbox"/> LPN: 2116	<input type="checkbox"/> 6183		
<input checked="" type="checkbox"/> 327	12/03/2020	---	<input type="checkbox"/> LPN: 3116	<input type="checkbox"/> 7183		
				<input type="checkbox"/> 8183		
				<input type="checkbox"/> 9183		

A 'Products found' notification indicates: 'Lots, pallets and/or serial numbers were found for the specified product and date range.'

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

157. The Accused Products practice “authenticating the draft informational object created by the authorized authoring member.” For example, each Accused Product authenticates

each ordered transaction [draft informational object] via a consensus protocol. Specifically, each Accused Product distributes the ordered transaction from the ordering service to the channel peers on the network for validation, as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

158. During the validation process, each Accused Product employs a consensus protocol/mechanism to check the validity of each endorsed transaction proposal within the ordered transaction. As IBM explains, “[a] consensus protocol agreed to by all participating members of the business network ensures that the ledger is updated only with network-verified transactions.”⁶³ Therefore, the Accused Products authenticate as required by claim 1 of the ’000 Patent via the validation process.

⁶³ *Blockchain Basics: Introduction to Distributed Ledgers*, IBM (last updated June 1, 2019), available at <https://developer.ibm.com/tutorials/cl-blockchain-basics-intro-bluemix-trs>.

159. The Accused Products practice “converting the authenticated informational object created by the authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier.” For example, once the peers authenticate the ordered transaction via the aforementioned validation process [authenticated informational object], each Accused Product converts that ordered transaction into an immutable block [immutable informational object], which is identified by a block hash [unique identifier] for tracking the immutable block on the blockchain. As IBM explains, “each block contains a hash (a digital fingerprint or unique identifier),”⁶⁴ as shown below:

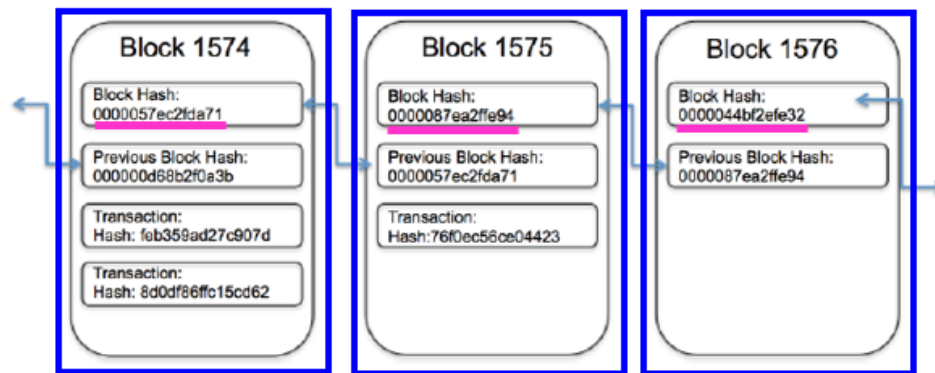

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

160. The Accused Products practice “writing the created immutable informational object into a memory for use by authorized accessing members.” For example, each Accused Product appends [writes] each authenticated block [created immutable informational object] to the record (i.e., block) preceding it on the shared ledger of the network [into a memory] via each peer on the channel to become accessible [for use] to permissioned users [authorized accessing members]

⁶⁴ Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>.

(e.g., to access, inspect, or add to the data via the creation of a new block). Once the block is committed to the shared ledger, it is immutably written into a memory that cannot be tampered with or changed.

161. The Accused Products practice “transmitting offer data from the authorized authoring member to members identified in the offer data to enable the identified members to access and change data corresponding to data that is contained in the immutable informational object.” On information and belief, each Accused Product sends permission data to enable certain additional permissioned users [members identified in the offer data] to access and change data contained in the previous block through the creation of an additional block that reuses data contained in the previous block [copy of the immutable informational object]. Specifically, each Accused Product enables a console administrator (e.g., a permissioned client) [authorized authoring member] to set permissions, via permission mapping, to constrain network participation, such as allowing certain additional permissioned users [an independent member] to access and change a previous block through the creation of an additional block. In doing so, the underlying data associated with a previous transaction is updated according to changes or introduction of new data, with the new or changed information of the additional block relating back to the previous block’s information. Within each Accused Product, the “[i]dentity and access management (IAM) allows the owner of a console to control which users have access to the console and their privileges within it. IAM is built into the blockchain console and includes local console authentication and role management.”⁶⁵

⁶⁵ *Security*, IBM Documentation for IBM Blockchain Platform v2.1.2 (last updated Nov. 2, 2020), available at <https://cloud.ibm.com/docs/blockchain-sw?topic=blockchain-sw-ibp-security#ibp-security-ibp>.

162. The Accused Products practice “enabling members identified in the offer data to access and change data corresponding to data that is contained in the immutable informational object to an extent and for a duration defined by permissions set by the authorized authoring member in the offer data.” For example, each Accused Product enables a console administrator (e.g., a permissioned client) [authorized authoring member] to set permissions, via permission mapping, to constrain network participation, such as allowing certain additional permissioned users [members identified in the offer data] to access and change data contained in the previous block [immutable object] through the creation of an additional block that reuses data contained in the previous block. In doing so, the underlying data associated with a previous transaction is updated according to changes or introduction of new data, with the new or changed information of the additional block relating back to the previous block’s information. Within each Accused Product, the “[i]dentity and access management (IAM) allows the owner of a console to control which users have access to the console and their privileges within it. IAM is built into the blockchain console and includes local console authentication and role management.”⁶⁶ On information and belief, each Accused Product enables a permissioned client [authorized authoring member] to set permissions that restrict the extent and duration to which the block may be accessed and changed.

163. The Accused Products practice “creating a copy of the immutable informational object.” For example, on information and belief, each Accused Product enables certain permissioned users [members identified in the offer data], via permission mapping, to create a copy of the previous block through the creation of an additional block that reuses data contained

⁶⁶ *Security*, IBM Documentation for IBM Blockchain Platform v2.1.2 (last updated Nov. 2, 2020), available at <https://cloud.ibm.com/docs/blockchain-sw?topic=blockchain-sw-ibp-security#ibp-security-ibp>.

in the previous block. Within each Accused Product, the “[i]dentity and access management (IAM) allows the owner of a console to control which users have access to the console and their privileges within it. IAM is built into the blockchain console and includes local console authentication and role management.”⁶⁷

164. The Accused Products practice “enabling an identified accessing member to revise data contained in the copy of the immutable informational object to the extent and for the duration defined by the permissions.” For example, each Accused Product enables a console administrator (e.g., a permissioned client) [authorized authoring member] to set permissions, via permission mapping, to constrain network participation, such as allowing certain additional permissioned users [identified accessing member] to revise data contained in the previous block through the creation of an additional block that reuses data contained in the previous block [copy of the immutable informational object]. In doing so, the underlying data associated with a previous transaction is updated according to changes or introduction of new data, with the new or changed information of the additional block relating back to the previous block’s information. Within each Accused Product, the “[i]dentity and access management (IAM) allows the owner of a console to control which users have access to the console and their privileges within it. IAM is built into the blockchain console and includes local console authentication and role management.”⁶⁸ On information and belief, each Accused Product enables a permissioned client [identified accessing

⁶⁷ *Security*, IBM Documentation for IBM Blockchain Platform v2.1.2 (last updated Nov. 2, 2020), available at <https://cloud.ibm.com/docs/blockchain-sw?topic=blockchain-sw-ibp-security#ibp-security-ibp>.

⁶⁸ *Security*, IBM Documentation for IBM Blockchain Platform v2.1.2 (last updated Nov. 2, 2020), available at <https://cloud.ibm.com/docs/blockchain-sw?topic=blockchain-sw-ibp-security#ibp-security-ibp>.

member] to set permissions that define and restrict the extent and duration to which the block may be accessed and changed.

165. The Accused Products practice “relating the copy of the immutable informational object, containing the revised data, to the immutable informational object.” For example, each Accused Product enables permissioned users [members identified in the offer data] to access and change data corresponding to a previous block through the creation of an additional block. In doing so, the underlying data associated with a previous transaction is updated according to changes or introduction of new data, with the new or changed information of the additional block relating back to the previous block’s information.

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

166. In addition and/or in the alternative to its direct infringements, IBM has indirectly infringed one or more claims of the ’000 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the Accused Products.

167. At a minimum, IBM has had knowledge of the ’000 Patent based at least on its conduct before the United States Patent and Trademark Office (“USPTO”). For example, U.S. Patent Application Publication No. US2007/0061360 A1 (the publication of the ’668 Patent) was cited by the Examiner during the prosecution of U.S. Patent Application Publication No. 2012/0150925 A1, entitled “Proactive Method for Improved Reliability for Sustained Persistence of Immutable Files in Storage Clouds” and assigned to IBM. In addition, IBM has constructive knowledge of the ’000 Patent given Pardalis’ compliance with 35 U.S.C. § 287.

168. In addition, prior to this lawsuit being filed, Pardalis corresponded with IBM and agents of IBM related to the '696 Patent, the Common Point Authoring System for Tracking And Authenticating Objects in a Distribution Chain, U.S. pending continuation patent application #20040093501 (notice of allowance issued in July, 2006), and the fact that both the '696 Patent and application #20040093501 had been distinguished from an IBM patent (i.e., U.S. Patent No. 6,438,560).

169. Also, prior to this lawsuit being filed, Pardalis communicated with IBM and agents of IBM—Dr. Dean Martin and Dr. Pat Selinger (separately)—regarding Pardalis' patented methods for protecting data ownership rights along complex supply chains.

170. Moreover, IBM has constructive knowledge of the '000 Patent given Pardalis' compliance with 35 U.S.C. § 287. Moreover, IBM has initiated several platforms, such as IBM IP Advisor with Watson ("IPA"), which is a tool allowing users (and IBM) to "easily navigate complex documents and patents to identify relevant patents for possible infringement and show evidence about the results. By digesting and analyzing large amounts of data, sorting it for relevancy and enabling natural language processing of queries, IPA saves patent engineers, IP attorneys and inventors time, while increasing accuracy of results. IPA is a cognitive patent search platform that combines deep IP and patent knowledge with AI from Watson Discovery, News, Analytics and Knowledge Studio. It leverages natural language processing for analysis in addition to standard structured queries. IPA is Kubernetes-based for multi-cloud implementations. It is currently on the IBM Public Cloud, and the security around the Watson collections and cloud access ensure that your proprietary data is secure. This solution is easily supported on other cloud

solutions and supports multiple use cases.”⁶⁹ And several Pardalis patents cite to IBM patents as forward citations, such as U.S. Patent No. 6,438,560 (*e.g.*, citations by the ’696 Patent). Upon information and belief, IBM has knowledge of the ’000 Patent through its creation and use of IBM IP Advisor with Watson.

171. And in another IBM project, IBM partnered with a company called IPwe to “begin representing patents as non-fungible tokens (NFTs) or digital assets by working with IBM (NYSE: IBM) to create the infrastructure for representing patents as NFTs and storing the records on a blockchain network.”⁷⁰ “These NFTs will be stored and shared on the IPwe Platform, hosted on IBM Cloud and powered by IBM Blockchain. The IPwe Platform also enables the Global Patent Marketplace, which allows owners and other members of the patent ecosystem to engage and transact, buy, license, finance, sell, research and commercialize patents. IPwe, working with IBM, was the first to create a patent marketplace on the blockchain. The introduction of NFTs will only help accelerate the opportunity for IP, which has been notoriously difficult to manage, value and transact, to be treated as a liquid asset.” *Id.* IBM and IPwe also “[c]reated the Global Patent Registry (GPR) powered by AI and blockchain.”⁷¹ This project between IBM and IPE is described:

IPwe enlisted the help of IBM to create a unique suite of products to fit its needs. Working from the IBM Cloud®, the company combines IBM® Blockchain technology with multiple IBM Watson® AI solutions to increase visibility and flexibility within the complex patent market for both buyers and sellers. IPwe uses AI capabilities to make sense of the millions of patents circulating globally, each averaging a minimum of 20 pages. By blending natural language processing (NLP), predictive analytics and machine learning from IBM Watson, IPwe can rapidly analyze patent information. It can then use the information to generate summaries and reports to help users identify lucrative opportunities while steering clear of

⁶⁹ *IBM IP Advisor with Watson*, IBM (2020), available at <https://www.ibm.com/downloads/cas/YV9PMLEB>.

⁷⁰ IBM Newsroom, available at <https://newsroom.ibm.com/2021-04-20-IPwe-and-IBM-Seek-to-Transform-Corporate-Patents-With-Next-Generation-NFTs-Using-IBM-Blockchain>.

⁷¹ *AI and Blockchain help discover and transact IP*, IBM (2021), available at <https://www.ibm.com/case-studies/ipwe/>.

potential commercial risks. “IPwe helps companies discover what it is they have and what their competitors have from an IP perspective at a lower cost, what are the risk factors associated with it, and what can they do to generate a higher return on those intangible assets,” says Spangenberg. “We’ve made it possible for companies to be transparent in transactional activity, whether it be a license or acquisition transaction.” Leveraging AI and blockchain allowed IPwe to build an automated and transparent Global Patent Registry (GPR). The GPR is the world’s first blockchain registry collecting current, active and historical patent records in a single, freely accessible registry. The technology helps remove the barriers to understanding the critical aspects of patent information. It allows for both record keeping of and smart contracts for an underlying asset.

Id.

172. Further, “IPwe is partnering with IBM to accelerate its mission to address the inefficiencies in the patent marketplace. IBM Cloud and IBM Blockchain teams are working closely with IPwe on a multi-year project to assist IPwe in its mission to deliver world class solutions to its enterprise, SME, university, law firms, research institutions and government customers, with a heavy emphasis on meeting the needs of financial, technology and risk management executives. In addition to giving patent owners tools that provide greater visibility, effective management, and ease of conducting transactions with patents, the IPwe Platform reduces costs for innovators, and creates commercial opportunities for those that wish to partner or engage in financial transactions. The IPwe Platform, is a comprehensive solution that helps patent owners better understand and manage their patent assets. The IPwe Platform enables patent owners to: Better understand your own patent portfolios — AI driven analytical tools identify commercially or financially interesting patents and evaluate relevance, importance, transactional value and other metrics that are easily understood. Understand your position and the IP-based competitive landscape with tools to compare the relative strengths of your portfolio with your actual and potential competitors’ IP positions. Evaluate and manage IP risk in ways that were simply not possible before, by proactively identifying sources of risk and utilizing mitigation strategies targeted to managing that risk on a far more cost-effective basis. Make it much simpler

and less expensive to conduct all kinds of patent transactions, including acquisitions, licensing, sales, insurance, patent pooling and financings. With patent assets, security and privacy being paramount, the IPwe platform leverages smart contracts underpinned by blockchain running on IBM Cloud.”⁷² Upon information and belief, IBM has knowledge of the ’000 Patent through its creation and participation in these projects with IPwe.

173. Upon information and belief, since at least the above-mentioned instances when IBM was on notice of the ’000 Patent, IBM has actively induced the direct infringements of its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Such inducements have been committed with the knowledge, or with willful blindness to the fact, that the acts induced constitute infringement of the ’000 Patent. Indeed, IBM intended to cause and took affirmative steps to induce infringement by, among other things, creating and disseminating advertisements and instructive materials that promote the infringing use of the Accused Products;⁷³ creating and/or maintaining established distribution channels for the Accused Products into and within the United States; manufacturing the Accused Products in conformity with U.S. laws and regulations; distributing or making available technical documentation supporting use of the Accused Products that promote their features, specifications, and applications—including webinars, interactive sessions, white papers, brochures, and manuals;⁷⁴ providing developer tools for the Accused Products—including

software development kits (SDKs) and application programming interfaces (APIs); testing and certifying blockchain features in the Accused Products; and by providing technical support, onboarding services, product updates, tutorials, training, and/or related services for these products to purchasers in the United States.⁷⁵

Damages

174. Pardalis has been damaged as a result of IBM's infringing conduct described in this Count. IBM is, thus, liable to Pardalis in an amount that adequately compensates Pardalis for IBM's infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

COUNT V

(INFRINGEMENT OF U.S. PATENT NO. 9,690,765)

175. Plaintiff incorporates the preceding paragraphs herein by reference.

176. This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, *et seq.*

177. Pardalis is the owner of all substantial rights, title, and interest in and to the '765 Patent including the right to exclude others and to enforce, sue, and recover damages for past infringements.

Platform, IBM Documentation, available at <https://cloud.ibm.com/docs/blockchain>; Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 7 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>; *IBM Blockchain Platform Console Video Series*, IBM (last updated July 1, 2020), available at <https://developer.ibm.com/series/ibm-blockchain-platform-console-video-series/>.

⁷⁵ *See., e.g., IBM Support for Hyperledger Fabric*, available at www.ibm.com/cloud/blockchain-platform/hyperledger-fabric-support; *Blockchain Tutorials*, IBM Developer, available at <https://developer.ibm.com/technologies/blockchain/tutorials/>; *IBM Blockchain 101: Quick-start guide for developers*, IBM Developer, available at <https://developer.ibm.com/tutorials/cl-ibm-blockchain-101-quick-start-guide-for-developers-bluemix-trs/>.

178. The '765 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on June 27, 2017, after full and fair examination.

179. IBM has directly and/or indirectly infringed (by inducing infringement) one or more claims of the '765 Patent in this District and elsewhere in Texas and the United States by making, using, selling, offering to sell, and/or importing, and by actively inducing others to make, use, sell, offer to sell, and/or import, IBM products, their components and processes, and/or products containing the same that incorporate the fundamental technologies covered by the '765 Patent, including, but not limited to, the Accused Products.

Direct Infringement (35 U.S.C. § 271(a))

180. IBM has directly infringed one or more claims of the '765 Patent in this District and elsewhere in Texas and the United States.

181. IBM has directly infringed, either by itself or via its agent(s), at least claim 1 of the '765 Patent as set forth under 35 U.S.C. § 271(a) by making, offering to sell, selling, testing, and/or using the Accused Products.

182. By way of illustration only, the Accused Products perform each and every element of claim 1 of the '765 Patent. The Accused Products perform “a method for maintaining data for use by authoring and accessing members to track uniquely identified products and informational objects.” For example, each Accused Product maintains a series of ordered and back-linked blocks within an append-only distributed system of records (i.e., a shared ledger) across a peer-to-peer network for permissioned clients and users [authoring and accessing members] to track uniquely identified assets [products] as well as uniquely identified blocks [informational objects] on the blockchain. On information and belief, permissioned users may use the unique transaction hash/transaction ID, associated with a specific transaction (e.g., specific product(s)) on the

blockchain, for tracking purposes. On information and belief, permissioned users may also use the block hash for tracking a block on the blockchain. As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”⁷⁶ “Once data is uploaded [by a permissioned client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date.”⁷⁷

183. The Accused Products practice “enabling an authorized authoring member to create data comprising a draft informational object, which uniquely identifies a product for tracking purposes.” For example, each Accused Product enables a permissioned client [authorized authoring member], via one or more certificate authorities, to create an ordered transaction containing one or more endorsed transaction proposals [data comprising a draft informational object] that uniquely identifies an asset [product] for tracking purposes. Specifically, the Accused Products utilize one or more certificate authorities to generate unique identities for each permissioned client, which enables the use of policies to constrain network participation (e.g., to read and/or write the shared ledger) and access to transaction details, as shown below:

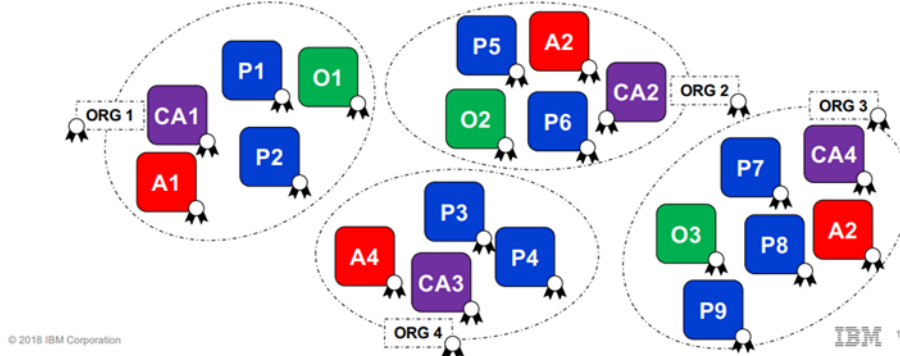

⁷⁶ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

⁷⁷ *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

The importance of identity

- Every actor has an associated X.509 identity issued by its organization's Certificate Authority
- A peer, orderer, application, organization, CA uses its identity to determine its organizational role
- This role determines the level of access an actor has to network resources, e.g. read/write the ledger

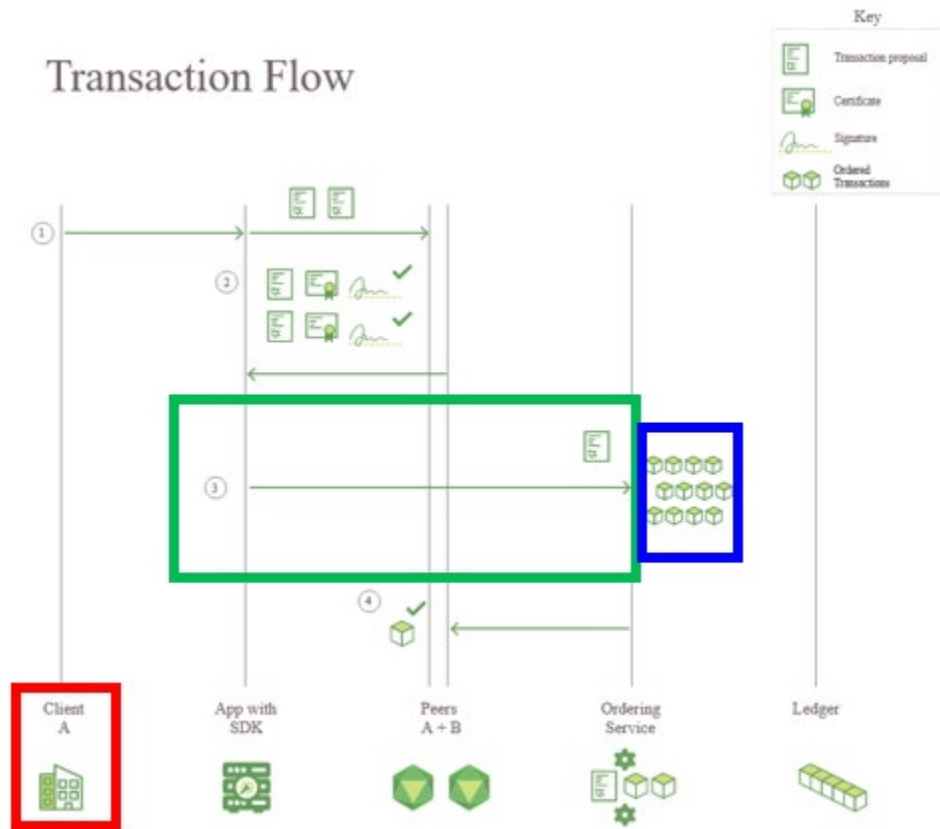

IBM Blockchain Platform: Technical Introduction, at p. 14 (2019, version 1.1).

184. When a client is authorized to write the ledger based on its unique identity [authorized authoring member], each Accused Product enables that permissioned client to create the ordered transaction containing one or more endorsed transaction proposals, as shown below:

Transaction Flow, available at <https://hyperledger-fabric.readthedocs.io/en/release-1.4/txflow.html> (emphasis added).

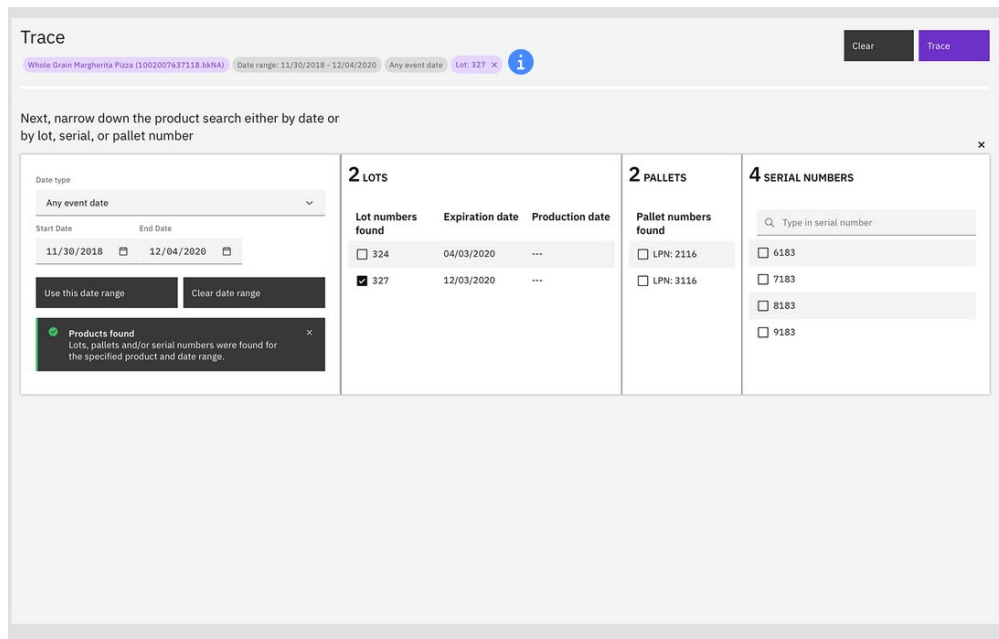

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

185. For example, IBM’s Food Trust blockchain solution enables a permissioned client [authorized authoring member] to create an ordered transaction [draft informational object] that uniquely identifies a food product (e.g., by the product’s ID, name or the associated PO number) for tracking purposes. Specifically, IBM’s Food Trust solution “assigns predefined roles that grant users authorization to execute specific network tasks on behalf of their organization”⁷⁸ in order to “provide[] participants with a permission-based, shared view of food ecosystem information, allowing convenient data publishing and controlled sharing of information.”⁷⁹ As IBM explains,

⁷⁸ *About IBM Food Trust* at p. 15, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

⁷⁹ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

“Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”⁸⁰ “Once data is uploaded [by a permissioned client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date,”⁸¹ as shown below:

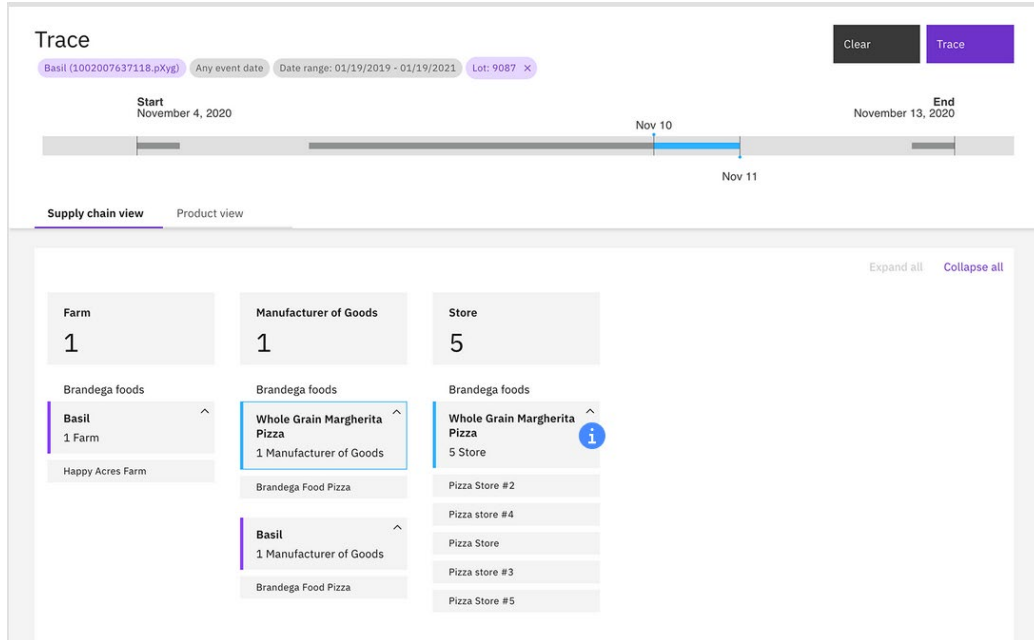

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

⁸⁰ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

⁸¹ *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

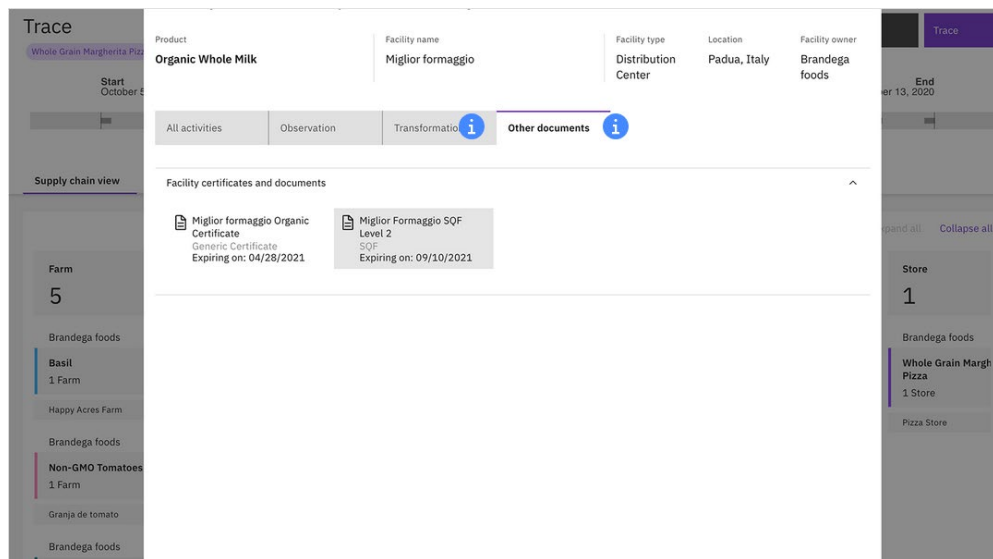

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

186. The Accused Products practice “authenticating said draft informational object, which uniquely identifies the product for tracking purposes, created by said authorized authoring

member.” For example, each Accused Product authenticates each ordered transaction [draft informational object] via a consensus protocol. Specifically, each Accused Product distributes the ordered transaction from the ordering service to the channel peers on the network for validation, as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

187. During the validation process, each Accused Product employs a consensus protocol/mechanism to check the validity of each endorsed transaction proposal within the ordered transaction [draft informational object]. As IBM explains, “[a] consensus protocol agreed to by all participating members of the business network ensures that the ledger is updated only with network-verified transactions.”⁸² Therefore, the Accused Products authenticate as required by

⁸² *Blockchain Basics: Introduction to Distributed Ledgers*, IBM (last updated June 1, 2019), available at <https://developer.ibm.com/tutorials/cl-blockchain-basics-intro-bluemix-trs>.

claim 1 of the '765 Patent via the validation process. Further, as discussed above, the ordered transaction uniquely identifies the product for tracking purposes. For example, IBM's Food Trust blockchain solution enables a permissioned client [authorized authoring member] to create an ordered transaction [draft informational object] that uniquely identifies a food product (e.g., by the product's ID, name or the associated PO number) for tracking purposes. As IBM explains, "Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates."⁸³ "Once data is uploaded [by a permissioned client], the trace module [of IBM's Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date."⁸⁴

188. The Accused Products practice "converting said authenticated informational object created by said authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier for tracking the immutable informational object." For example, once the peers authenticate the ordered transaction via the aforementioned validation process [authenticated informational object], each Accused Product converts that ordered transaction into an immutable block [immutable informational object], which is identified by a hash [unique identifier] for tracking the immutable block on the blockchain. As IBM explains, "each block contains a hash (a digital fingerprint or unique identifier),"⁸⁵ as shown below:

⁸³ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

⁸⁴ *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

⁸⁵ Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>.

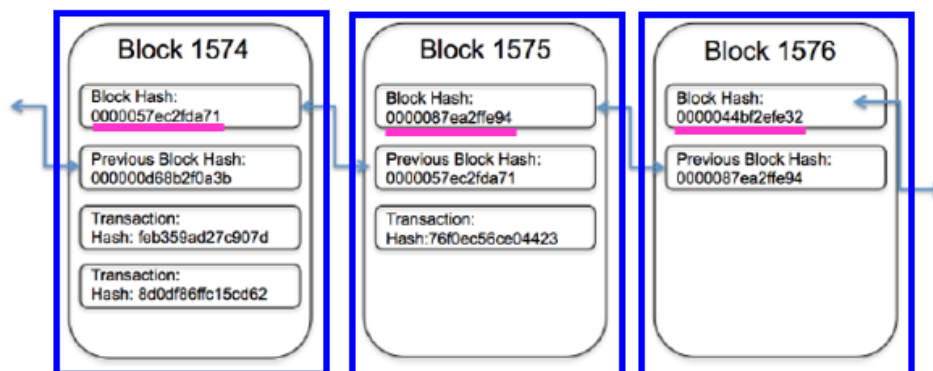

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

189. The Accused Products practice “writing said created immutable informational object into a memory for use by independent authorized accessing members.” For example, each Accused Product appends [writes] each authenticated block [created immutable informational object] to the record (i.e., block) preceding it on the shared ledger of the network [into a memory] via each peer on the channel to become accessible [for use] to permissioned users [independent authorized accessing members] (e.g., to access, inspect, or add to the data via the creation of a new block). Once the block is committed to the shared ledger, it is immutably written into a memory that cannot be tampered with or changed.

190. The Accused Products practice “enabling, in response to receipt of offer data from said authorized authoring member, an independent member identified in said offer data to access and change said immutable informational object to an extent and for a duration defined by permissions set by said authorized authoring member in said offer data.” For example, each Accused Product enables a console administrator (e.g., a permissioned client) [authorized authoring member] to set permissions, via permission mapping, to constrain network participation, such as allowing certain additional permissioned users [an independent member] to access and

change a previous block through the creation of an additional block. In doing so, the underlying data associated with a previous transaction is updated according to changes or introduction of new data, with the new or changed information of the additional block relating back to the previous block's information. Within each Accused Product, the “[i]dentity and access management (IAM) allows the owner of a console to control which users have access to the console and their privileges within it. IAM is built into the blockchain console and includes local console authentication and role management.”⁸⁶ On information and belief, each Accused Product enables a permissioned client [authorized authoring member] to set permissions that restrict the extent and duration to which the block may be accessed and changed.

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

191. In addition and/or in the alternative to its direct infringements, IBM has indirectly infringed one or more claims of the '765 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the Accused Products.

192. At a minimum, IBM has had knowledge of the '765 Patent based at least on its conduct before the United States Patent and Trademark Office (“USPTO”). For example, U.S. Patent Application Publication No. US2007/0061360 A1 (the publication of the '668 Patent) was cited by the Examiner during the prosecution of U.S. Patent Application Publication No. 2012/0150925 A1, entitled “Proactive Method for Improved Reliability for Sustained Persistence of Immutable Files in Storage Clouds” and assigned to IBM.

⁸⁶ *Security*, IBM Documentation for IBM Blockchain Platform v2.1.2 (last updated Nov. 2, 2020), available at <https://cloud.ibm.com/docs/blockchain-sw?topic=blockchain-sw-ibp-security#ibp-security-ibp>.

193. In addition, prior to this lawsuit being filed, Pardalis corresponded with IBM and agents of IBM related to the '696 Patent, the Common Point Authoring System for Tracking And Authenticating Objects in a Distribution Chain, U.S. pending continuation patent application #20040093501 (notice of allowance issued in July, 2006), and the fact that both the '696 Patent and application #20040093501 had been distinguished from an IBM patent (i.e., U.S. Patent No. 6,438,560).

194. Also, prior to this lawsuit being filed, Pardalis communicated with IBM and agents of IBM—Dr. Dean Martin and Dr. Pat Selinger (separately)—regarding Pardalis' patented methods for protecting data ownership rights along complex supply chains.

195. Moreover, IBM has constructive knowledge of the '765 Patent given Pardalis' compliance with 35 U.S.C. § 287. Moreover, IBM has initiated several platforms, such as IBM IP Advisor with Watson ("IPA"), which is a tool allowing users (and IBM) to "easily navigate complex documents and patents to identify relevant patents for possible infringement and show evidence about the results. By digesting and analyzing large amounts of data, sorting it for relevancy and enabling natural language processing of queries, IPA saves patent engineers, IP attorneys and inventors time, while increasing accuracy of results. IPA is a cognitive patent search platform that combines deep IP and patent knowledge with AI from Watson Discovery, News, Analytics and Knowledge Studio. It leverages natural language processing for analysis in addition to standard structured queries. IPA is Kubernetes-based for multi-cloud implementations. It is currently on the IBM Public Cloud, and the security around the Watson collections and cloud access ensure that your proprietary data is secure. This solution is easily supported on other cloud

solutions and supports multiple use cases.”⁸⁷ And several Pardalis patents cite to IBM patents as forward citations, such as U.S. Patent No. 6,438,560 (*e.g.*, citations by the ’696 Patent). Upon information and belief, IBM has knowledge of the ’765 Patent through its creation and use of IBM IP Advisor with Watson.

196. And in another IBM project, IBM partnered with a company called IPwe to “begin representing patents as non-fungible tokens (NFTs) or digital assets by working with IBM (NYSE: IBM) to create the infrastructure for representing patents as NFTs and storing the records on a blockchain network.”⁸⁸ “These NFTs will be stored and shared on the IPwe Platform, hosted on IBM Cloud and powered by IBM Blockchain. The IPwe Platform also enables the Global Patent Marketplace, which allows owners and other members of the patent ecosystem to engage and transact, buy, license, finance, sell, research and commercialize patents. IPwe, working with IBM, was the first to create a patent marketplace on the blockchain. The introduction of NFTs will only help accelerate the opportunity for IP, which has been notoriously difficult to manage, value and transact, to be treated as a liquid asset.” *Id.* IBM and IPwe also “[c]reated the Global Patent Registry (GPR) powered by AI and blockchain.”⁸⁹ This project between IBM and IPE is described:

IPwe enlisted the help of IBM to create a unique suite of products to fit its needs. Working from the IBM Cloud®, the company combines IBM® Blockchain technology with multiple IBM Watson® AI solutions to increase visibility and flexibility within the complex patent market for both buyers and sellers. IPwe uses AI capabilities to make sense of the millions of patents circulating globally, each averaging a minimum of 20 pages. By blending natural language processing (NLP), predictive analytics and machine learning from IBM Watson, IPwe can rapidly analyze patent information. It can then use the information to generate summaries and reports to help users identify lucrative opportunities while steering clear of

⁸⁷ *IBM IP Advisor with Watson*, IBM (2020), available at <https://www.ibm.com/downloads/cas/YV9PMLEB>.

⁸⁸ IBM Newsroom, available at <https://newsroom.ibm.com/2021-04-20-IPwe-and-IBM-Seek-to-Transform-Corporate-Patents-With-Next-Generation-NFTs-Using-IBM-Blockchain>.

⁸⁹ *AI and Blockchain help discover and transact IP*, IBM (2021), available at <https://www.ibm.com/case-studies/ipwe/>.

potential commercial risks. “IPwe helps companies discover what it is they have and what their competitors have from an IP perspective at a lower cost, what are the risk factors associated with it, and what can they do to generate a higher return on those intangible assets,” says Spangenberg. “We’ve made it possible for companies to be transparent in transactional activity, whether it be a license or acquisition transaction.” Leveraging AI and blockchain allowed IPwe to build an automated and transparent Global Patent Registry (GPR). The GPR is the world’s first blockchain registry collecting current, active and historical patent records in a single, freely accessible registry. The technology helps remove the barriers to understanding the critical aspects of patent information. It allows for both record keeping of and smart contracts for an underlying asset.

Id.

197. Further, “IPwe is partnering with IBM to accelerate its mission to address the inefficiencies in the patent marketplace. IBM Cloud and IBM Blockchain teams are working closely with IPwe on a multi-year project to assist IPwe in its mission to deliver world class solutions to its enterprise, SME, university, law firms, research institutions and government customers, with a heavy emphasis on meeting the needs of financial, technology and risk management executives. In addition to giving patent owners tools that provide greater visibility, effective management, and ease of conducting transactions with patents, the IPwe Platform reduces costs for innovators, and creates commercial opportunities for those that wish to partner or engage in financial transactions. The IPwe Platform, is a comprehensive solution that helps patent owners better understand and manage their patent assets. The IPwe Platform enables patent owners to: Better understand your own patent portfolios — AI driven analytical tools identify commercially or financially interesting patents and evaluate relevance, importance, transactional value and other metrics that are easily understood. Understand your position and the IP-based competitive landscape with tools to compare the relative strengths of your portfolio with your actual and potential competitors’ IP positions. Evaluate and manage IP risk in ways that were simply not possible before, by proactively identifying sources of risk and utilizing mitigation strategies targeted to managing that risk on a far more cost-effective basis. Make it much simpler

and less expensive to conduct all kinds of patent transactions, including acquisitions, licensing, sales, insurance, patent pooling and financings. With patent assets, security and privacy being paramount, the IPwe platform leverages smart contracts underpinned by blockchain running on IBM Cloud.”⁹⁰ Upon information and belief, IBM has knowledge of the ’765 Patent through its creation and participation in these projects with IPwe.

198. Upon information and belief, since at least the above-mentioned instances when IBM was on notice of the ’765 Patent, IBM has actively induced the direct infringements of its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Such inducements have been committed with the knowledge, or with willful blindness to the fact, that the acts induced constitute infringement of the ’765 Patent. Indeed, IBM intended to cause and took affirmative steps to induce infringement by, among other things, creating and disseminating advertisements and instructive materials that promote the infringing use of the Accused Products;⁹¹ creating and/or maintaining established distribution channels for the Accused Products into and within the United States; manufacturing the Accused Products in conformity with U.S. laws and regulations; distributing or making available technical documentation supporting use of the Accused Products that promote their features, specifications, and applications—including webinars, interactive sessions, white papers, brochures, and manuals;⁹² providing developer tools for the Accused Products—including

software development kits (SDKs) and application programming interfaces (APIs); testing and certifying blockchain features in the Accused Products; and by providing technical support, onboarding services, product updates, tutorials, training, and/or related services for these products to purchasers in the United States.⁹³

Damages

199. Pardalis has been damaged as a result of IBM's infringing conduct described in this Count. IBM is, thus, liable to Pardalis in an amount that adequately compensates Pardalis for IBM's infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

COUNT VI

(INFRINGEMENT OF U.S. PATENT NO. 10,409,902)

200. Plaintiff incorporates the preceding paragraphs herein by reference.

201. This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, *et seq.*

202. Pardalis is the owner of all substantial rights, title, and interest in and to the '902 Patent including the right to exclude others and to enforce, sue, and recover damages for past infringements.

Platform, IBM Documentation, available at <https://cloud.ibm.com/docs/blockchain>; Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 7 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>; *IBM Blockchain Platform Console Video Series*, IBM (last updated July 1, 2020), available at <https://developer.ibm.com/series/ibm-blockchain-platform-console-video-series/>.

⁹³ See., e.g., *IBM Support for Hyperledger Fabric*, available at www.ibm.com/cloud/blockchain-platform/hyperledger-fabric-support; *Blockchain Tutorials*, IBM Developer, available at <https://developer.ibm.com/technologies/blockchain/tutorials/>; *IBM Blockchain 101: Quick-start guide for developers*, IBM Developer, available at <https://developer.ibm.com/tutorials/cl-ibm-blockchain-101-quick-start-guide-for-developers-bluemix-trs/>.

203. The '902 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on September 10, 2019, after full and fair examination.

204. IBM has directly and/or indirectly infringed (by inducing infringement) one or more claims of the '902 Patent in this District and elsewhere in Texas and the United States by making, using, selling, offering to sell, and/or importing, and by actively inducing others to make, use, sell, offer to sell, and/or import, IBM products, their components and processes, and/or products containing the same that incorporate the fundamental technologies covered by the '902 Patent, including, but not limited to, the Accused Products.

Direct Infringement (35 U.S.C. § 271(a))

205. IBM has directly infringed one or more claims of the '902 Patent in this District and elsewhere in Texas and the United States.

206. IBM has directly infringed, either by itself or via its agent(s), at least claim 1 of the '902 Patent as set forth under 35 U.S.C. § 271(a) by making, offering to sell, selling, testing, and/or using the Accused Products.

207. By way of illustration only, the Accused Products perform each and every element of claim 1 of the '902 Patent. The Accused Products perform “a method for maintaining data for use by authoring and accessing members to track uniquely identified products and informational objects.” For example, each Accused Product maintains a series of ordered and back-linked blocks within an append-only distributed system of records (i.e., a shared ledger) across a peer-to-peer network for permissioned clients and users [authoring and accessing members] to track uniquely identified assets [products] as well as uniquely identified blocks [informational objects] on the blockchain. On information and belief, permissioned users may use the unique transaction hash/transaction ID, associated with a specific transaction (e.g., specific product(s)) on the

blockchain, for tracking purposes. On information and belief, permissioned users may also use the block hash for tracking a block on the blockchain. For example, IBM’s Food Trust blockchain solution maintains data (e.g., food supply chain data) on a blockchain ledger to provide a permission-based, shared view of food ecosystem information for permissioned users to track uniquely identified food products. As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”⁹⁴ “Once data is uploaded [by a permissioned client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date.”⁹⁵

208. The Accused Products practice “enabling an authorized authoring member to create data comprising a draft informational object, which uniquely identifies a product for tracking purposes.” For example, each Accused Product enables a permissioned client [authorized authoring member], via one or more certificate authorities, to create an ordered transaction containing one or more endorsed transaction proposals [data comprising a draft informational object] that uniquely identifies an asset [product] for tracking purposes. Specifically, the Accused Products utilize one or more certificate authorities to generate unique identities for each permissioned client, which enables the use of policies to constrain network participation (e.g., to read and/or write the shared ledger) and access to transaction details, as shown below:

⁹⁴ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

⁹⁵ *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

The importance of identity

- Every actor has an associated X.509 identity issued by its organization's Certificate Authority
- A peer, orderer, application, organization, CA uses its identity to determine its organizational role
- This role determines the level of access an actor has to network resources, e.g. read/write the ledger

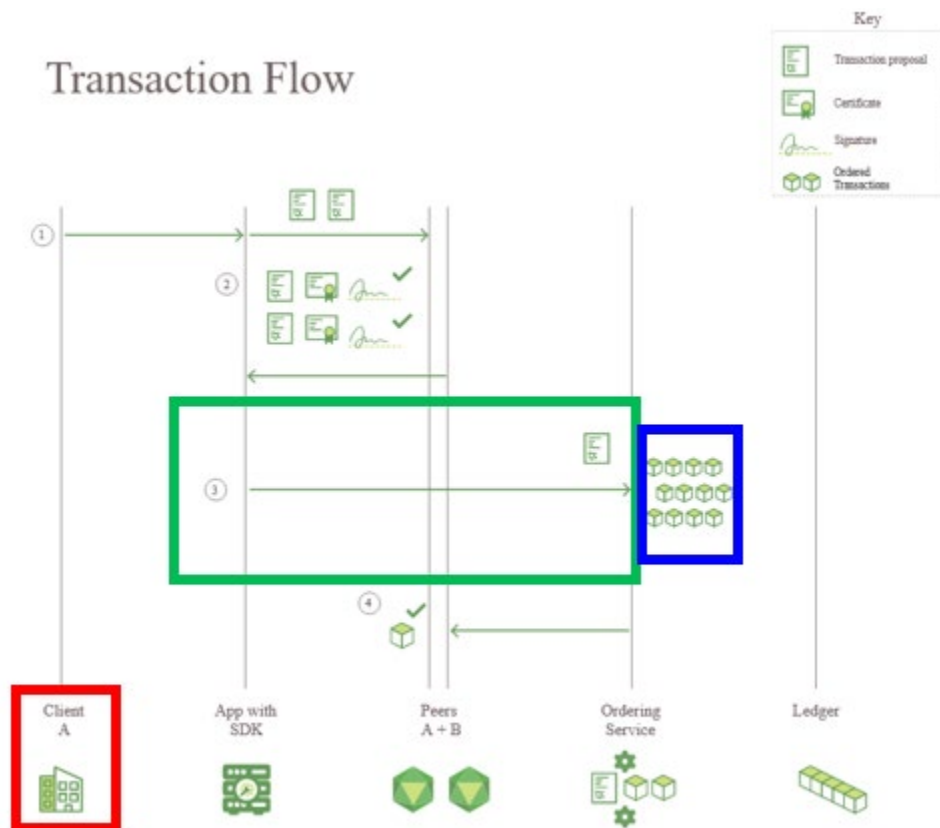

IBM Blockchain Platform: Technical Introduction, at p. 14 (2019, version 1.1).

209. When a client is authorized to write the ledger based on its unique identity [authorized authoring member], each Accused Product enables that permissioned client to create the ordered transaction containing one or more endorsed transaction proposals, as shown below:

Transaction Flow, available at <https://hyperledger-fabric.readthedocs.io/en/release-1.4/txflow.html> (emphasis added).

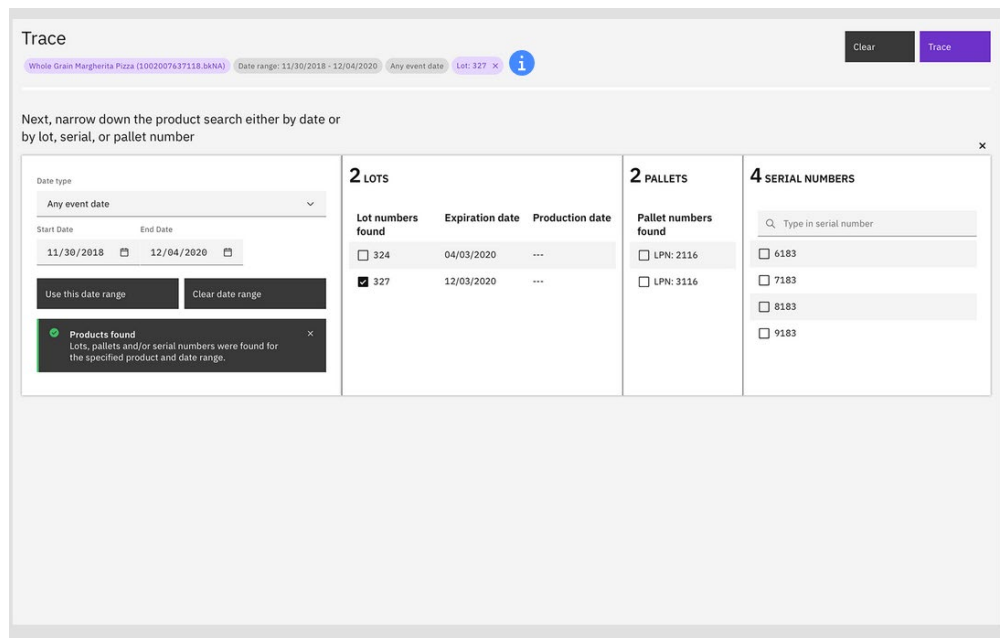

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

210. For example, IBM’s Food Trust blockchain solution enables a permissioned client [authorized authoring member] to create an ordered transaction [draft informational object] that uniquely identifies a food product (e.g., by the product’s ID, name or the associated PO number) for tracking purposes. Specifically, IBM’s Food Trust solution “assigns predefined roles that grant users authorization to execute specific network tasks on behalf of their organization”⁹⁶ in order to “provide[] participants with a permission-based, shared view of food ecosystem information,

⁹⁶ *About IBM Food Trust* at p. 15, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

allowing convenient data publishing and controlled sharing of information.”⁹⁷ As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”⁹⁸ “Once data is uploaded [by a permitted client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date,”⁹⁹ as shown below:

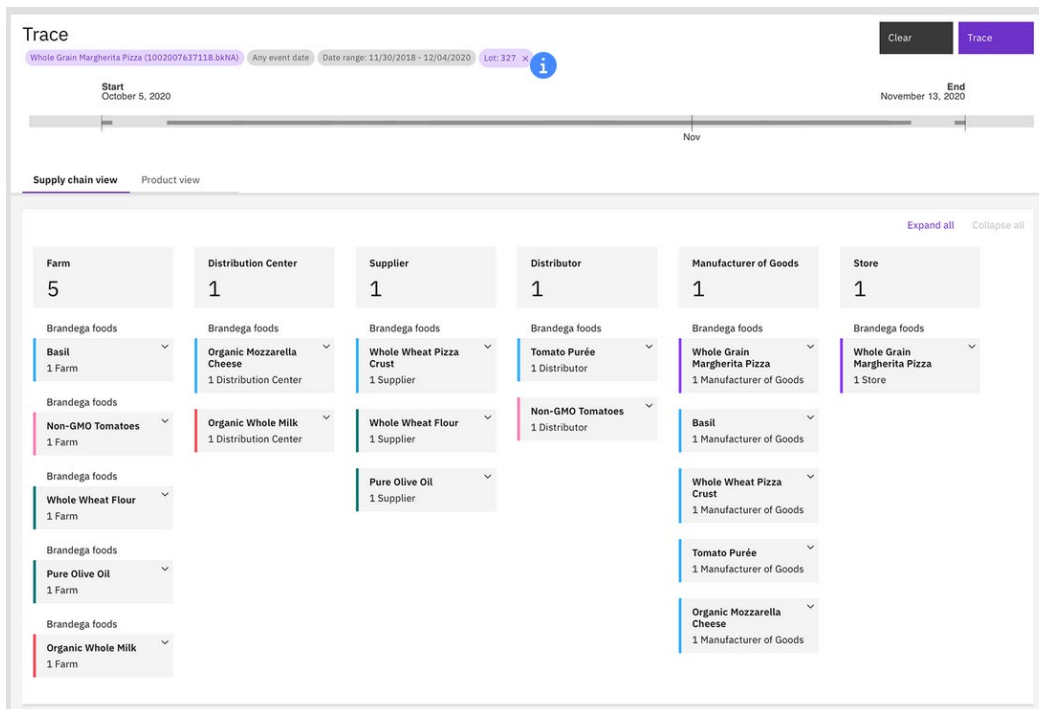

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

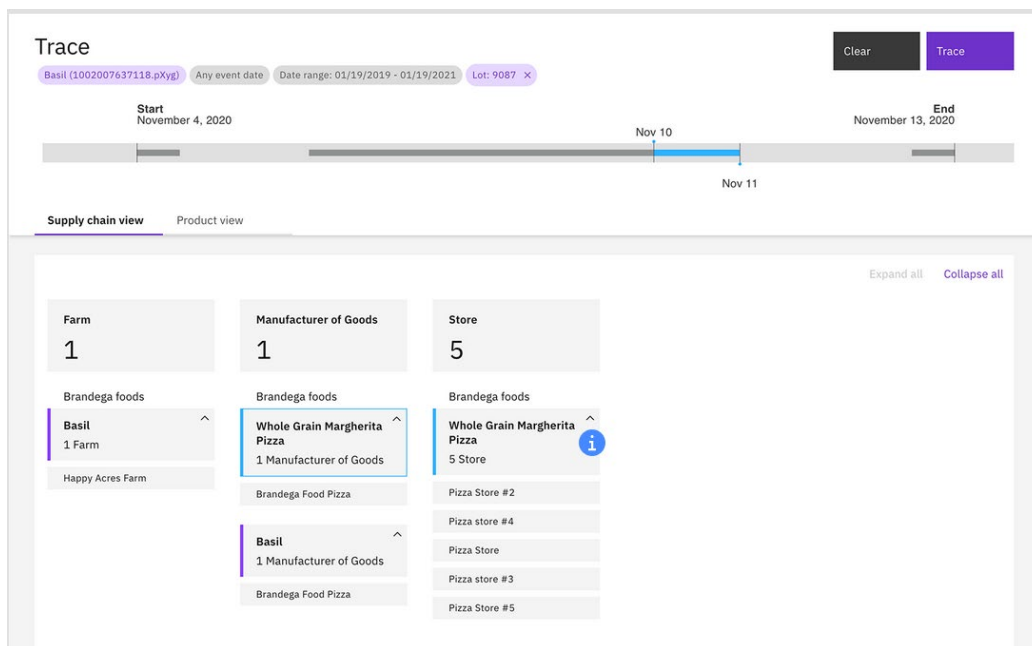

⁹⁷ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

⁹⁸ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

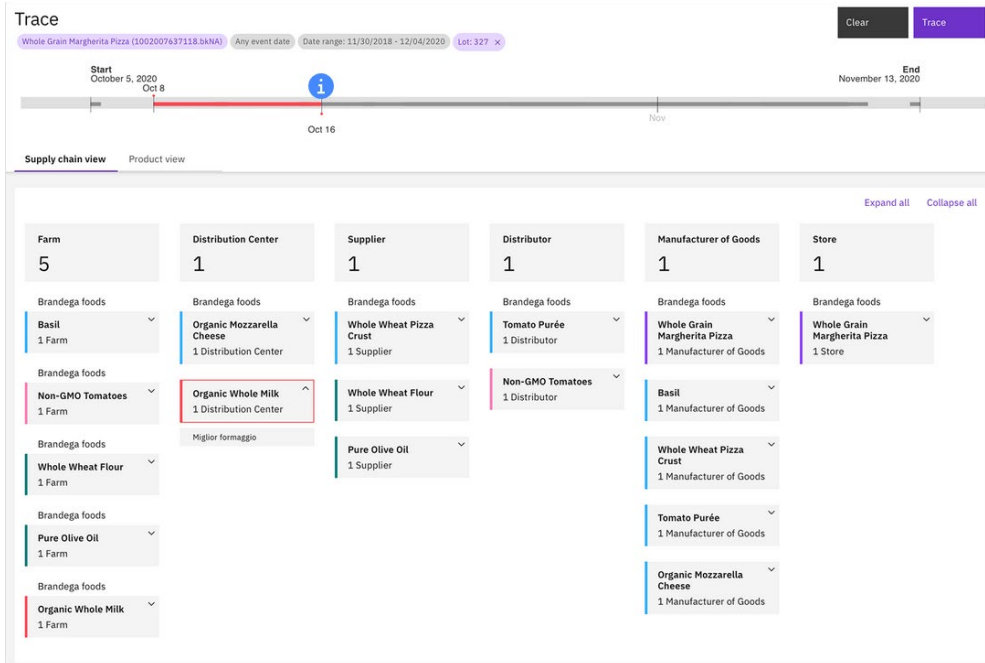

⁹⁹ *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

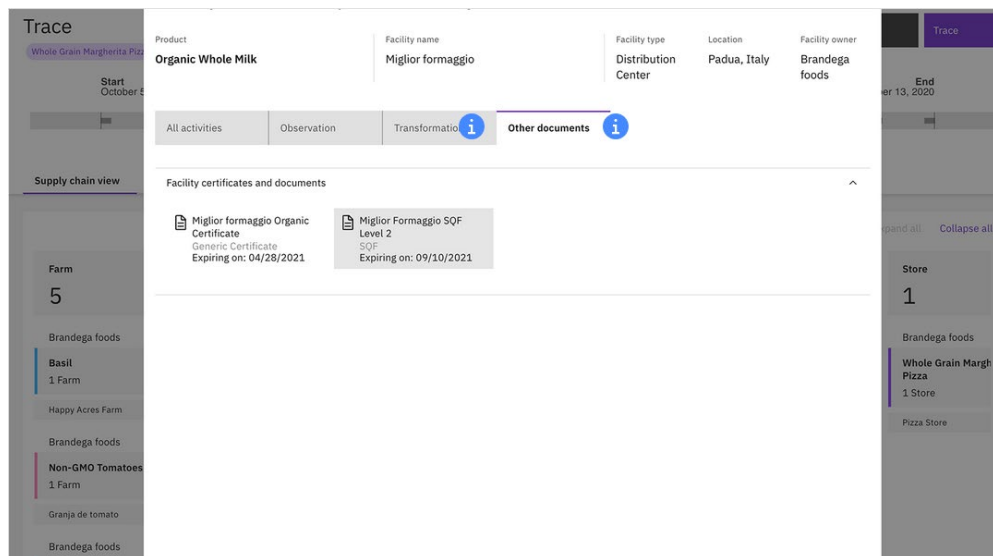

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

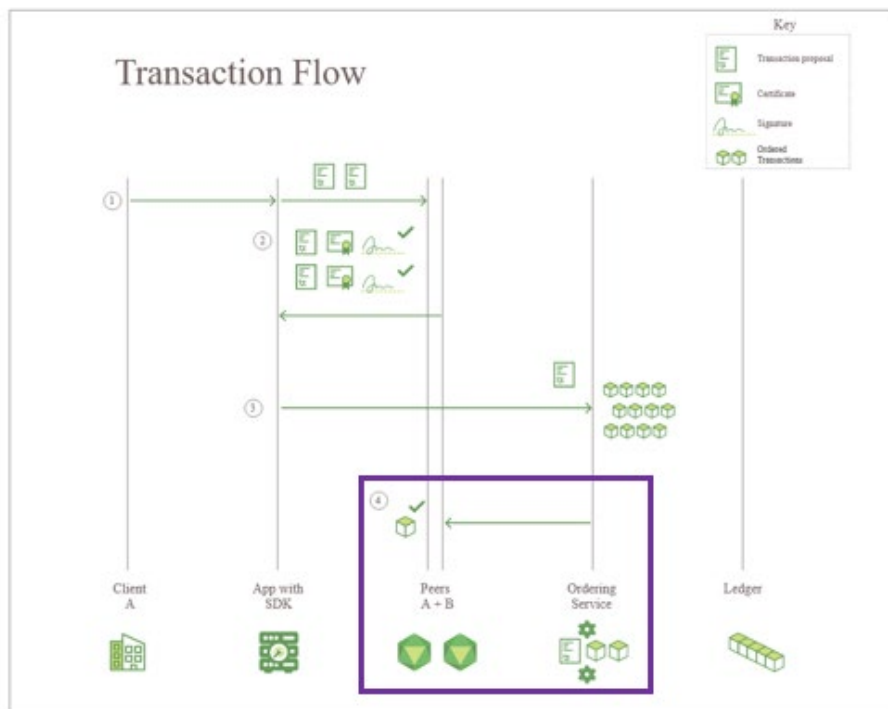

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

211. The Accused Products practice “authenticating the draft informational object, which uniquely identifies the product for tracking purposes, created by the authorized authoring member.” For example, each Accused Product authenticates each ordered transaction [draft

informational object] via a consensus protocol. Specifically, each Accused Product distributes the ordered transaction from the ordering service to the channel peers on the network for validation, as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

212. During the validation process, each Accused Product employs a consensus protocol/mechanism to check the validity of each endorsed transaction proposal within the ordered transaction. As IBM explains, “[a] consensus protocol agreed to by all participating members of the business network ensures that the ledger is updated only with network-verified transactions.”¹⁰⁰ Therefore, the Accused Products authenticate as required by claim 1 of the ’902 Patent via the validation process. Further, as discussed above, the ordered transaction uniquely identifies the

¹⁰⁰ *Blockchain Basics: Introduction to Distributed Ledgers*, IBM (last updated June 1, 2019), available at <https://developer.ibm.com/tutorials/cl-blockchain-basics-intro-bluemix-trs>.

product for tracking purposes. For example, IBM’s Food Trust blockchain solution enables a permissioned client [authorized authoring member] to create an ordered transaction [draft informational object] that uniquely identifies a food product (e.g., by the product’s ID, name or the associated PO number) for tracking purposes. As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”¹⁰¹ “Once data is uploaded [by a permissioned client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date.”¹⁰²

213. The Accused Products practice “converting authenticated informational object created by the authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier for tracking the immutable informational object.” For example, once the peers authenticate the ordered transaction via the aforementioned validation process [authenticated informational object], each Accused Product converts that ordered transaction into an immutable block [immutable informational object], which is identified by a hash [unique identifier] for tracking the immutable block on the blockchain. As IBM explains, “each block contains a hash (a digital fingerprint or unique identifier),”¹⁰³ as shown below:

¹⁰¹ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

¹⁰² *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

¹⁰³ Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>.

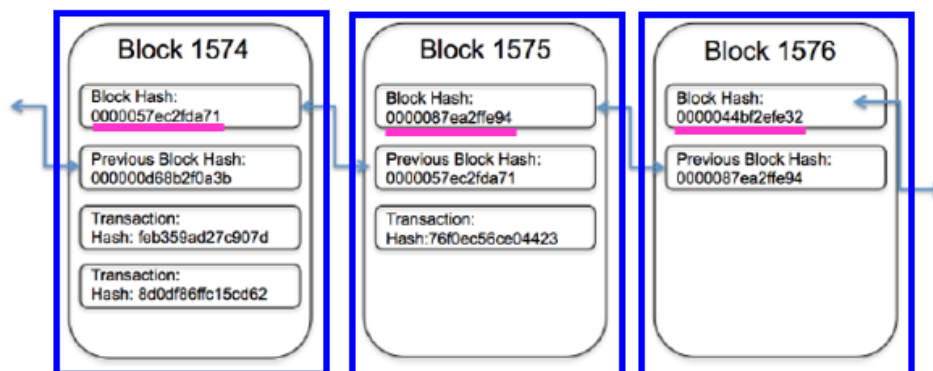

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

214. The Accused Products practice “writing the created immutable informational object into a memory for use by independent authorized accessing members.” For example, each Accused Product appends [writes] each authenticated block [created immutable informational object] to the record (i.e., block) preceding it on the shared ledger of the network [into a memory] via each peer on the channel to become accessible [for use] to permissioned users [independent authorized accessing members] (e.g., to access, inspect, or add to the data via the creation of a new block). Once the block is committed to the shared ledger, it is immutably written into a memory that cannot be tampered with or changed.

215. The Accused Products practice “enabling, in response to receipt of offer data from said authorized authoring member, an independent member identified in said offer data to access a copy of the immutable informational object to an extent and for a duration defined by permissions set by the authorized authoring member in said offer data.” For example, each Accused Product enables a console administrator (e.g., a permissioned client) [authorized authoring member] to set permissions, via permission mapping, to constrain network participation, such as allowing certain additional permissioned users [an independent member] to access a copy of the block. Within each

Accused Product, the “[i]dentity and access management (IAM) allows the owner of a console to control which users have access to the console and their privileges within it. IAM is built into the blockchain console and includes local console authentication and role management.”¹⁰⁴ On information and belief, each Accused Product enables a permissioned client [authorized authoring member] to set permissions that restrict the extent and duration to which the block may be accessed.

216. The Accused Products practice “enabling, in response to receipt of offer data from said authorized authoring member, an independent member identified in said offer data to revise data contained in the copy of the immutable informational object to the extent and for the duration defined by the permissions.” For example, each Accused Product enables a permissioned client [authorized authoring member] to set permissions, via permission mapping, to constrain network participation, such as allowing certain additional permissioned users [an independent member] to revise data contained in the copy of the block. In doing so, the underlying data associated with a previous transaction is updated according to changes or introduction of new data, with the new or changed information of the additional block relating back to the previous block’s information. Within each Accused Product, the “[i]dentity and access management (IAM) allows the owner of a console to control which users have access to the console and their privileges within it. IAM is built into the blockchain console and includes local console authentication and role management.”¹⁰⁵ On information and belief, each Accused Product enables a permissioned client

¹⁰⁵ *Security*, IBM Documentation for IBM Blockchain Platform v2.1.2 (last updated Nov. 2, 2020), available at <https://cloud.ibm.com/docs/blockchain-sw?topic=blockchain-sw-ibp-security#ibp-security-ibp>.

[authorized authoring member] to set permissions that restrict the extent and duration to which the block may be revised.

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

217. In addition and/or in the alternative to its direct infringements, IBM has indirectly infringed one or more claims of the '902 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the Accused Products.

218. At a minimum, IBM has had knowledge of the '902 Patent based at least on its conduct before the United States Patent and Trademark Office ("USPTO"). For example, U.S. Patent Application Publication No. US2007/0061360 A1 (the publication of the '668 Patent) was cited by the Examiner during the prosecution of U.S. Patent Application Publication No. 2012/0150925 A1, entitled "Proactive Method for Improved Reliability for Sustained Persistence of Immutable Files in Storage Clouds" and assigned to IBM. In addition, IBM has constructive knowledge of the '902 Patent given Pardalis' compliance with 35 U.S.C. § 287.

219. In addition, prior to this lawsuit being filed, Pardalis corresponded with IBM and agents of IBM related to the '696 Patent, the Common Point Authoring System for Tracking And Authenticating Objects in a Distribution Chain, U.S. pending continuation patent application #20040093501 (notice of allowance issued in July, 2006), and the fact that both the '696 Patent and application #20040093501 had been distinguished from an IBM patent (i.e., U.S. Patent No. 6,438,560).

220. Also, prior to this lawsuit being filed, Pardalis communicated with IBM and agents of IBM—Dr. Dean Martin and Dr. Pat Selinger (separately)—regarding Pardalis’ patented methods for protecting data ownership rights along complex supply chains.

221. Moreover, IBM has constructive knowledge of the ’902 Patent given Pardalis’ compliance with 35 U.S.C. § 287. Moreover, IBM has initiated several platforms, such as IBM IP Advisor with Watson (“IPA”), which is a tool allowing users (and IBM) to “easily navigate complex documents and patents to identify relevant patents for possible infringement and show evidence about the results. By digesting and analyzing large amounts of data, sorting it for relevancy and enabling natural language processing of queries, IPA saves patent engineers, IP attorneys and inventors time, while increasing accuracy of results. IPA is a cognitive patent search platform that combines deep IP and patent knowledge with AI from Watson Discovery, News, Analytics and Knowledge Studio. It leverages natural language processing for analysis in addition to standard structured queries. IPA is Kubernetes-based for multi-cloud implementations. It is currently on the IBM Public Cloud, and the security around the Watson collections and cloud access ensure that your proprietary data is secure. This solution is easily supported on other cloud solutions and supports multiple use cases.”¹⁰⁶ And several Pardalis patents cite to IBM patents as forward citations, such as U.S. Patent No. 6,438,560 (*e.g.*, citations by the ’696 Patent). Upon information and belief, IBM has knowledge of the ’902 Patent through its creation and use of IBM IP Advisor with Watson.

222. And in another IBM project, IBM partnered with a company called IPwe to “begin representing patents as non-fungible tokens (NFTs) or digital assets by working with IBM (NYSE:

¹⁰⁶ *IBM IP Advisor with Watson*, IBM (2020), available at <https://www.ibm.com/downloads/cas/YV9PMLEB>.

IBM) to create the infrastructure for representing patents as NFTs and storing the records on a blockchain network.”¹⁰⁷ “These NFTs will be stored and shared on the IPwe Platform, hosted on IBM Cloud and powered by IBM Blockchain. The IPwe Platform also enables the Global Patent Marketplace, which allows owners and other members of the patent ecosystem to engage and transact, buy, license, finance, sell, research and commercialize patents. IPwe, working with IBM, was the first to create a patent marketplace on the blockchain. The introduction of NFTs will only help accelerate the opportunity for IP, which has been notoriously difficult to manage, value and transact, to be treated as a liquid asset.” *Id.* IBM and IPwe also “[c]reated the Global Patent Registry (GPR) powered by AI and blockchain.”¹⁰⁸ This project between IBM and IPE is described:

IPwe enlisted the help of IBM to create a unique suite of products to fit its needs. Working from the IBM Cloud®, the company combines IBM® Blockchain technology with multiple IBM Watson® AI solutions to increase visibility and flexibility within the complex patent market for both buyers and sellers. IPwe uses AI capabilities to make sense of the millions of patents circulating globally, each averaging a minimum of 20 pages. By blending natural language processing (NLP), predictive analytics and machine learning from IBM Watson, IPwe can rapidly analyze patent information. It can then use the information to generate summaries and reports to help users identify lucrative opportunities while steering clear of potential commercial risks. “IPwe helps companies discover what it is they have and what their competitors have from an IP perspective at a lower cost, what are the risk factors associated with it, and what can they do to generate a higher return on those intangible assets,” says Spangenberg. “We’ve made it possible for companies to be transparent in transactional activity, whether it be a license or acquisition transaction.” Leveraging AI and blockchain allowed IPwe to build an automated and transparent Global Patent Registry (GPR). The GPR is the world’s first blockchain registry collecting current, active and historical patent records in a single, freely accessible registry. The technology helps remove the barriers to understanding the critical aspects of patent information. It allows for both record keeping of and smart contracts for an underlying asset.

Id.

223. Further, “IPwe is partnering with IBM to accelerate its mission to address the inefficiencies in the patent marketplace. IBM Cloud and IBM Blockchain teams are working closely with IPwe on a multi-year project to assist IPwe in its mission to deliver world class solutions to its enterprise, SME, university, law firms, research institutions and government customers, with a heavy emphasis on meeting the needs of financial, technology and risk management executives. In addition to giving patent owners tools that provide greater visibility, effective management, and ease of conducting transactions with patents, the IPwe Platform reduces costs for innovators, and creates commercial opportunities for those that wish to partner or engage in financial transactions. The IPwe Platform, is a comprehensive solution that helps patent owners better understand and manage their patent assets. The IPwe Platform enables patent owners to: Better understand your own patent portfolios — AI driven analytical tools identify commercially or financially interesting patents and evaluate relevance, importance, transactional value and other metrics that are easily understood. Understand your position and the IP-based competitive landscape with tools to compare the relative strengths of your portfolio with your actual and potential competitors’ IP positions. Evaluate and manage IP risk in ways that were simply not possible before, by proactively identifying sources of risk and utilizing mitigation strategies targeted to managing that risk on a far more cost-effective basis. Make it much simpler and less expensive to conduct all kinds of patent transactions, including acquisitions, licensing, sales, insurance, patent pooling and financings. With patent assets, security and privacy being paramount, the IPwe platform leverages smart contracts underpinned by blockchain running on

IBM Cloud.”¹⁰⁹ Upon information and belief, IBM has knowledge of the ’902 Patent through its creation and participation in these projects with IPwe.

224. Upon information and belief, since at least the above-mentioned instances when IBM was on notice of the ’902 Patent, IBM has actively induced the direct infringements of its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Such inducements have been committed with the knowledge, or with willful blindness to the fact, that the acts induced constitute infringement of the ’902 Patent. Indeed, IBM intended to cause and took affirmative steps to induce infringement by, among other things, creating and disseminating advertisements and instructive materials that promote the infringing use of the Accused Products;¹¹⁰ creating and/or maintaining established distribution channels for the Accused Products into and within the United States; manufacturing the Accused Products in conformity with U.S. laws and regulations; distributing or making available technical documentation supporting use of the Accused Products that promote their features, specifications, and applications—including webinars, interactive sessions, white papers, brochures, and manuals;¹¹¹ providing developer tools for the Accused Products—including

software development kits (SDKs) and application programming interfaces (APIs); testing and certifying blockchain features in the Accused Products; and by providing technical support, onboarding services, product updates, tutorials, training, and/or related services for these products to purchasers in the United States.¹¹²

Damages

225. Pardalis has been damaged as a result of IBM's infringing conduct described in this Count. IBM is, thus, liable to Pardalis in an amount that adequately compensates Pardalis for IBM's infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

COUNT VII

(INFRINGEMENT OF U.S. PATENT NO. 11,126,790)

226. Plaintiff incorporates the preceding paragraphs herein by reference.

227. This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, *et seq.*

228. Pardalis is the owner of all substantial rights, title, and interest in and to the '790 Patent including the right to exclude others and to enforce, sue, and recover damages for past infringements.

229. The '790 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on September 21, 2021, after full and fair examination.

¹¹² *See, e.g., IBM Support for Hyperledger Fabric*, available at www.ibm.com/cloud/blockchain-platform/hyperledger-fabric-support; *Blockchain Tutorials*, IBM Developer, available at <https://developer.ibm.com/technologies/blockchain/tutorials/>; *IBM Blockchain 101: Quick-start guide for developers*, IBM Developer, available at <https://developer.ibm.com/tutorials/cl-ibm-blockchain-101-quick-start-guide-for-developers-bluemix-trs/>.

230. IBM has directly and/or indirectly infringed (by inducing infringement) one or more claims of the '790 Patent in this District and elsewhere in Texas and the United States by making, using, selling, offering to sell, and/or importing, and by actively inducing others to make, use, sell, offer to sell, and/or import, IBM products, their components and processes, and/or products containing the same that incorporate the fundamental technologies covered by the '790 Patent, including, but not limited to, the Accused Products.

Direct Infringement (35 U.S.C. § 271(a))

231. IBM has directly infringed one or more claims of the '790 Patent in this District and elsewhere in Texas and the United States.

232. IBM has directly infringed, either by itself or via its agent(s), at least claim 1 of the '790 Patent as set forth under 35 U.S.C. § 271(a) by making, offering to sell, selling, testing, and/or using the Accused Products.

233. By way of illustration only, the Accused Products perform each and every element of claim 1 of the '790 Patent. The Accused Products perform “a method for maintaining data for use by authoring and accessing members to track uniquely identified processed products and informational objects.” For example, each Accused Product maintains a series of ordered and back-linked blocks within an append-only distributed system of records (i.e., a shared ledger) across a peer-to-peer network for permissioned clients and users [authoring and accessing members] to track uniquely identified assets [products] as well as uniquely identified blocks [informational objects] within the blockchain. On information and belief, permissioned users may use the unique transaction hash/transaction ID, associated with a specific transaction (e.g., specific product(s)) on the blockchain, for tracking purposes. On information and belief, permissioned users may also use the block hash for tracking a block on the blockchain. For example, IBM's Food Trust blockchain

solution maintains data (e.g., food supply chain data) on a blockchain ledger to provide a permission-based, shared view of food ecosystem information for permissioned users to track uniquely identified food products. As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”¹¹³ “Once data is uploaded [by a permissioned client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date.”¹¹⁴

234. The Accused Products practice “enabling an authorized authoring member to create data comprising a draft informational object, which uniquely identifies a processed product for tracking purposes.” For example, each Accused Product enables a permissioned client [authorized authoring member], via one or more certificate authorities, to create an ordered transaction containing one or more endorsed transaction proposals [data comprising a draft informational object] that uniquely identifies an asset [processed product] for tracking purposes. Specifically, the Accused Products utilize one or more certificate authorities to generate unique identities for each permissioned client, which enables the use of policies to constrain network participation (e.g., to read and/or write the shared ledger) and access to transaction details, as shown below:

¹¹³ *About IBM Food Trust* at p. 5, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

¹¹⁴ *About IBM Food Trust* at p. 7, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

The importance of identity

- Every actor has an associated X.509 identity issued by its organization's Certificate Authority
- A peer, orderer, application, organization, CA uses its identity to determine its organizational role
- This role determines the level of access an actor has to network resources, e.g. read/write the ledger

IBM Blockchain Platform: Technical Introduction, at p. 14 (2019, version 1.1).

235. When a client is authorized to write the ledger based on its unique identity [authorized authoring member], each Accused Product enables that permissioned client to create the ordered transaction containing one or more endorsed transaction proposals, as shown below:

Transaction Flow, available at <https://hyperledger-fabric.readthedocs.io/en/release-1.4/txflow.html> (emphasis added).

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

236. For example, IBM’s Food Trust blockchain solution enables a permitted client [authorized authoring member] to create an ordered transaction [draft informational object] that uniquely identifies a food product (e.g., by the product’s ID, name or the associated PO number) for tracking purposes. Specifically, IBM’s Food Trust solution “assigns predefined roles that grant users authorization to execute specific network tasks on behalf of their organization”¹¹⁵ in order to “provide[] participants with a permission-based, shared view of food ecosystem information,

¹¹⁵ *About IBM Food Trust* at p. 15, IBM (2019), available at <https://www.ibm.com/downloads/cas/8QABQBDR>.

allowing convenient data publishing and controlled sharing of information.”¹¹⁶ As IBM explains, “Food Trust solution users can quickly locate items from the supply chain, in real time, by querying food product identifiers such as Global Trade Item Number (GTIN) or Universal Product Code (UPC) [unique identification], using the product name and filtering on dates.”¹¹⁷ “Once data is uploaded [by a permitted client], the trace module [of IBM’s Food Trust] allows an authorized user to search the provenance of a food product (via GTIN, product name, or Purchase Order) and can narrow down by a specific date,”¹¹⁸ as shown below:

The screenshot displays the 'Trace' interface for 'Whole Grain Margherita Pizza (1002007637118.88NA)'. The search parameters are set to 'Any event date' with a date range from 11/30/2018 to 12/04/2020. The results are categorized into three sections: '2 LOTS', '2 PALLETS', and '4 SERIAL NUMBERS'. The 'LOTS' section shows two entries: lot 324 (expired 04/03/2020) and lot 327 (expired 12/03/2020). The 'PALLETS' section shows two entries: LPN: 2116 and LPN: 3116. The 'SERIAL NUMBERS' section shows four entries: 6183, 7183, 8183, and 9183. A 'Products found' notification indicates that lots, pallets, and/or serial numbers were found for the specified product and date range.

Lot numbers found	Expiration date	Production date

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

IBM Food Trust: Trace, IBM, available at <https://www.ibm.com/blockchain/resources/food-trust/demo/trace>.

237. The Accused Products practice “authenticating the draft informational object, which uniquely identifies the processed product for tracking purposes, created by the authorized authoring member.” For example, each Accused Product authenticates each ordered transaction

[draft informational object] via a consensus protocol. Specifically, each Accused Product distributes the ordered transaction from the ordering service to the channel peers on the network for validation, as shown below:

IBM Blockchain Platform for IBM Cloud, IBM, available at <https://cloud.ibm.com/docs/blockchain/reference?topic=blockchain-hyperledger-fabric#hyperledger-fabric-certificate-authority> (emphasis added).

238. During the validation process, each Accused Product employs a consensus protocol/mechanism to check the validity of each endorsed transaction proposal within the ordered transaction. As IBM explains, “[a] consensus protocol agreed to by all participating members of the business network ensures that the ledger is updated only with network-verified transactions.”¹¹⁹ Therefore, the Accused Products authenticate as required by claim 1 of the ’790 Patent via the validation process. Further, as discussed above, the ordered transaction uniquely identifies the

¹¹⁹ *Blockchain Basics: Introduction to Distributed Ledgers*, IBM (last updated June 1, 2019), available at <https://developer.ibm.com/tutorials/cl-blockchain-basics-intro-bluemix-trs>.

product for tracking purposes. For example, IBM’s Food Trust blockchain solution enables a permissioned client [authorized authoring member] to create an ordered transaction [draft informational object] that uniquely identifies a food product (e.g., by the product’s ID, name or the associated PO number) for tracking purposes.

239. The Accused Products practice “converting authenticated informational object created by the authorized authoring member to a corresponding immutable informational object which is identified by a unique identifier for tracking the immutable informational object.” For example, once the peers authenticate the ordered transaction via the aforementioned validation process [authenticated informational object], each Accused Product converts that ordered transaction into an immutable block, which is identified by a hash [unique identifier] for tracking the immutable block on the blockchain. As IBM explains, “each block contains a hash (a digital fingerprint or unique identifier),”¹²⁰ as shown below:

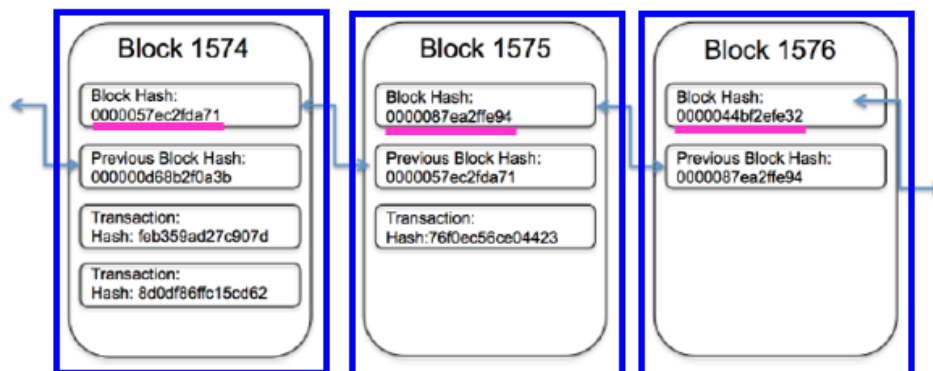

FIGURE 2-1: Blockchain stores transaction records in a series of connected blocks.

Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain> (emphasis added).

¹²⁰ Manav Gupta, *Blockchain for Dummies: 3rd IBM Limited Edition*, at p. 14 (2020), available at <https://www.ibm.com/topics/what-is-blockchain>.

240. The Accused Products practice “writing the created immutable informational object into a memory for use by independent authorized accessing members.” For example, each Accused Product appends [writes] each authenticated block [created immutable informational object] to the record (i.e., block) preceding it on the shared ledger of the network [into a memory] via each peer on the channel to become accessible [for use] to permissioned users [independent authorized accessing members] (e.g., to access, inspect, or add to the data via the creation of a new block). Once the block is committed to the shared ledger, it is immutably written into a memory that cannot be tampered with or changed.

241. The Accused Products practice “enabling, in response to receipt of offer data from the authorized authoring member, an independent member identified in the offer data to access a copy of the immutable informational object to an extent and for a duration defined by permissions set by the authorized authoring member in the offer data.” For example, each Accused Product enables a console administrator (e.g., a permissioned client) [authorized authoring member] to set permissions, via permission mapping, to constrain network participation, such as allowing certain additional permissioned users [an independent member] to access a copy of the block. Within each Accused Product, the “[i]dentity and access management (IAM) allows the owner of a console to control which users have access to the console and their privileges within it. IAM is built into the blockchain console and includes local console authentication and role management.”¹²¹ On information and belief, each Accused Product enables a permissioned client [authorized authoring member] to set permissions that restrict the extent and duration to which the block may be accessed.

¹²¹ <https://cloud.ibm.com/docs/blockchain-sw?topic=blockchain-sw-ibp-security>

242. The Accused Products practice the element of “enabling, in response to receipt of offer data from the authorized authoring member, an independent member identified in the offer data to revise data contained in the copy of the immutable informational object to the extent and for the duration defined by the permissions.” For example, each Accused Product enables a console administrator (e.g., a permissioned client) [authorized authoring member] to set permissions, via permission mapping, to constrain network participation, such as allowing certain additional permissioned users [an independent member] to revise data contained in the copy of the block. In doing so, the underlying data associated with a previous transaction is updated according to changes or introduction of new data, with the new or changed information of the additional block relating back to the previous block’s information. Within each Accused Product, the “[i]dentity and access management (IAM) allows the owner of a console to control which users have access to the console and their privileges within it. IAM is built into the blockchain console and includes local console authentication and role management.”¹²² On information and belief, each Accused Product enables a permissioned client [authorized authoring member] to set permissions that restrict the extent and duration to which the block may be revised.

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

243. In addition and/or in the alternative to its direct infringements, IBM has indirectly infringed one or more claims of the ’790 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the Accused Products.

¹²² *Security*, IBM Documentation for IBM Blockchain Platform v2.1.2 (last updated Nov. 2, 2020), available at <https://cloud.ibm.com/docs/blockchain-sw?topic=blockchain-sw-ibp-security#ibp-security-ibp>.

244. At a minimum, IBM has had knowledge of the '790 Patent based at least on its conduct before the United States Patent and Trademark Office ("USPTO"). For example, U.S. Patent Application Publication No. US2007/0061360 A1 (the publication of the '668 Patent) was cited by the Examiner during the prosecution of U.S. Patent Application Publication No. 2012/0150925 A1, entitled "Proactive Method for Improved Reliability for Sustained Persistence of Immutable Files in Storage Clouds" and assigned to IBM. In addition, IBM has constructive knowledge of the '790 Patent given Pardalis' compliance with 35 U.S.C. § 287.

245. In addition, prior to this lawsuit being filed, Pardalis corresponded with IBM and agents of IBM related to the '696 Patent, the Common Point Authoring System for Tracking And Authenticating Objects in a Distribution Chain, U.S. pending continuation patent application #20040093501 (notice of allowance issued in July, 2006), and the fact that both the '696 Patent and application #20040093501 had been distinguished from an IBM patent (i.e., U.S. Patent No. 6,438,560).

246. Also, prior to this lawsuit being filed, Pardalis communicated with IBM and agents of IBM—Dr. Dean Martin and Dr. Pat Selinger (separately)—regarding Pardalis' patented methods for protecting data ownership rights along complex supply chains.

247. Moreover, IBM has constructive knowledge of the '790 Patent given Pardalis' compliance with 35 U.S.C. § 287. Moreover, IBM has initiated several platforms, such as IBM IP Advisor with Watson ("IPA"), which is a tool allowing users (and IBM) to "easily navigate complex documents and patents to identify relevant patents for possible infringement and show evidence about the results. By digesting and analyzing large amounts of data, sorting it for relevancy and enabling natural language processing of queries, IPA saves patent engineers, IP attorneys and inventors time, while increasing accuracy of results. IPA is a cognitive patent search

platform that combines deep IP and patent knowledge with AI from Watson Discovery, News, Analytics and Knowledge Studio. It leverages natural language processing for analysis in addition to standard structured queries. IPA is Kubernetes-based for multi-cloud implementations. It is currently on the IBM Public Cloud, and the security around the Watson collections and cloud access ensure that your proprietary data is secure. This solution is easily supported on other cloud solutions and supports multiple use cases.”¹²³ And several Pardalis patents cite to IBM patents as forward citations, such as U.S. Patent No. 6,438,560 (*e.g.*, citations by the ’696 Patent). Upon information and belief, IBM has knowledge of the ’790 Patent through its creation and use of IBM IP Advisor with Watson.

248. And in another IBM project, IBM partnered with a company called IPwe to “begin representing patents as non-fungible tokens (NFTs) or digital assets by working with IBM (NYSE: IBM) to create the infrastructure for representing patents as NFTs and storing the records on a blockchain network.”¹²⁴ “These NFTs will be stored and shared on the IPwe Platform, hosted on IBM Cloud and powered by IBM Blockchain. The IPwe Platform also enables the Global Patent Marketplace, which allows owners and other members of the patent ecosystem to engage and transact, buy, license, finance, sell, research and commercialize patents. IPwe, working with IBM, was the first to create a patent marketplace on the blockchain. The introduction of NFTs will only help accelerate the opportunity for IP, which has been notoriously difficult to manage, value and transact, to be treated as a liquid asset.” *Id.* IBM and IPwe also “[c]reated the Global Patent

¹²³ *IBM IP Advisor with Watson*, IBM (2020), available at <https://www.ibm.com/downloads/cas/YV9PMLEB>.

¹²⁴ IBM Newsroom, available at <https://newsroom.ibm.com/2021-04-20-IPwe-and-IBM-Seek-to-Transform-Corporate-Patents-With-Next-Generation-NFTs-Using-IBM-Blockchain>.

Registry (GPR) powered by AI and blockchain.”¹²⁵ This project between IBM and IPE is described:

IPwe enlisted the help of IBM to create a unique suite of products to fit its needs. Working from the IBM Cloud®, the company combines IBM® Blockchain technology with multiple IBM Watson® AI solutions to increase visibility and flexibility within the complex patent market for both buyers and sellers. IPwe uses AI capabilities to make sense of the millions of patents circulating globally, each averaging a minimum of 20 pages. By blending natural language processing (NLP), predictive analytics and machine learning from IBM Watson, IPwe can rapidly analyze patent information. It can then use the information to generate summaries and reports to help users identify lucrative opportunities while steering clear of potential commercial risks. “IPwe helps companies discover what it is they have and what their competitors have from an IP perspective at a lower cost, what are the risk factors associated with it, and what can they do to generate a higher return on those intangible assets,” says Spangenberg. “We’ve made it possible for companies to be transparent in transactional activity, whether it be a license or acquisition transaction.” Leveraging AI and blockchain allowed IPwe to build an automated and transparent Global Patent Registry (GPR). The GPR is the world’s first blockchain registry collecting current, active and historical patent records in a single, freely accessible registry. The technology helps remove the barriers to understanding the critical aspects of patent information. It allows for both record keeping of and smart contracts for an underlying asset.

Id.

249. Further, “IPwe is partnering with IBM to accelerate its mission to address the inefficiencies in the patent marketplace. IBM Cloud and IBM Blockchain teams are working closely with IPwe on a multi-year project to assist IPwe in its mission to deliver world class solutions to its enterprise, SME, university, law firms, research institutions and government customers, with a heavy emphasis on meeting the needs of financial, technology and risk management executives. In addition to giving patent owners tools that provide greater visibility, effective management, and ease of conducting transactions with patents, the IPwe Platform reduces costs for innovators, and creates commercial opportunities for those that wish to partner

¹²⁵ *AI and Blockchain help discover and transact IP*, IBM (2021), available at <https://www.ibm.com/case-studies/ipwe/>.

or engage in financial transactions. The IPwe Platform, is a comprehensive solution that helps patent owners better understand and manage their patent assets. The IPwe Platform enables patent owners to: Better understand your own patent portfolios — AI driven analytical tools identify commercially or financially interesting patents and evaluate relevance, importance, transactional value and other metrics that are easily understood. Understand your position and the IP-based competitive landscape with tools to compare the relative strengths of your portfolio with your actual and potential competitors' IP positions. Evaluate and manage IP risk in ways that were simply not possible before, by proactively identifying sources of risk and utilizing mitigation strategies targeted to managing that risk on a far more cost-effective basis. Make it much simpler and less expensive to conduct all kinds of patent transactions, including acquisitions, licensing, sales, insurance, patent pooling and financings. With patent assets, security and privacy being paramount, the IPwe platform leverages smart contracts underpinned by blockchain running on IBM Cloud.”¹²⁶ Upon information and belief, IBM has knowledge of the '790 Patent through its creation and participation in these projects with IPwe.

250. Upon information and belief, since at least the above-mentioned instances when IBM was on notice of the '790 Patent, IBM has actively induced the direct infringements of its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Such inducements have been committed with the knowledge, or with willful blindness to the fact, that the acts induced constitute infringement of the '790 Patent. Indeed, IBM intended to cause and took affirmative steps to induce infringement by, among other things, creating and disseminating advertisements and instructive materials that

¹²⁶ See e.g., <https://www.ibm.com/blog/disrupting-the-patent-ecosystem-with-blockchain-and-ai/>

promote the infringing use of the Accused Products;¹²⁷ creating and/or maintaining established distribution channels for the Accused Products into and within the United States; manufacturing the Accused Products in conformity with U.S. laws and regulations; distributing or making available technical documentation supporting use of the Accused Products that promote their features, specifications, and applications—including webinars, interactive sessions, white papers, brochures, and manuals;¹²⁸ providing developer tools for the Accused Products—including software development kits (SDKs) and application programming interfaces (APIs); testing and certifying blockchain features in the Accused Products; and by providing technical support, onboarding services, product updates, tutorials, training, and/or related services for these products to purchasers in the United States.¹²⁹

Damages

251. Pardalis has been damaged as a result of IBM's infringing conduct described in this Count. IBM is, thus, liable to Pardalis in an amount that adequately compensates Pardalis for

IBM's infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

CONCLUSION

252. Pardalis is entitled to recover from IBM the damages sustained by Pardalis as a result of IBM's wrongful acts, in an amount subject to proof at trial, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court.

253. Pardalis has incurred and will incur attorneys' fees, costs, and expenses in the prosecution of this action. The circumstances of this dispute may give rise to an exceptional case within the meaning of 35 U.S.C. § 285, and Pardalis is entitled to recover its reasonable and necessary attorneys' fees, costs, and expenses.

JURY DEMAND

254. Pardalis hereby requests a trial by jury pursuant to Rule 38 of the Federal Rules of Civil Procedure.

PRAYER FOR RELIEF

255. Pardalis respectfully requests that the Court find in its favor and against IBM, and that the Court grant Pardalis the following relief:

- (i) A judgment that one or more claims of the Asserted Patents have been infringed, either literally and/or under the doctrine of equivalents, by Defendant;
- (ii) A judgment that Defendant account for and pay to Plaintiff all damages and costs incurred by Plaintiff because of Defendant's infringing activities and other conduct complained of herein, including an accounting for any sales or damages not presented at trial;

- (iii) A judgment that Plaintiff be granted pre-judgment interest on the damages caused by Defendant's infringing activities and other conduct complained of herein;
- (iv) A judgment that this case is exceptional under the provisions of 35 U.S.C. § 285 and award enhanced damages; and
- (v) Such other and further relief as the Court deems just and equitable.

Dated: October 11, 2023
